The Recommended Guilford County House Districts provide a narrowly tailored remedy to address the constitutional infirmity identified by the Court in Enacted 2017 District 57. They do so while splitting zero precincts, and achieving a higher average compactness score (on both the Reock and Polsby-Popper measures) than the Enacted 2011 plan, per the Court's order. They respect the boundaries of Greensboro by anchoring three districts largely within its borders. They do this while retaining two of the Enacted 2017 Districts in their entirety, making minimal changes to a third, and pairing no incumbents in a single district.

Response to Criticism of the Draft House Plan for Guilford County, Explanation of Changes Made in the Recommended Plan, and Provision of Alternative Plans

Several considerations led to revisions from the Special Master's Draft Plan to the Recommended Plan in Guilford County. First, the Plaintiffs made recommendations as to unpairing incumbents in Draft Plan District 59, to which the Legislative Defendants objected. Second, the Legislative Defendants, while not suggesting any changes, broadly criticized the plan as disrespecting state policy choices. Finally, in analyzing those criticisms and evaluating

the plan, the Special Master sought to improve the compactness of the districts to ensure that they met the Court's criterion that the Special Master's plan score higher than the Enacted 2011 Districts on the Reock and Polsby-Popper measures.

The Recommended Plan does not pair any incumbents. Moreover, every single incumbent retains a majority of his or her constituency from the 2017 Enacted Plan. By retaining Enacted 2017 House District 58, which had been altered by the Draft Plan, it now avoids the incumbent pairing in that district from the Draft Plan and need not address the Legislative Defendants' criticisms of potential partisanship in the Plaintiffs' plan to unpair them. Moreover, by retaining two Enacted 2017 House Districts (58 and 60) in their entirety, and a third (59) with minor revisions, the Recommended Plan respects, to the extent possible, the policy decisions the legislature made regarding Guilford County districts. It alters districts only to the extent necessary to remedy the constitutional infirmity in Enacted 2017 District 57.

Second, the Legislative Defendants made the following unfounded criticisms of the Special Master's Draft Plan. First, they argued that the plan "negated the legislature's policy choice to create a suburban district that followed city lines." Defendants' Reply Brief, at 3 n.2 ECF No. 218. If such was the legislature's goal, it failed to achieve it with the 2017 Enacted Districts. Neither Enacted 2017 District 61 nor 62 (the supposed suburban districts Legislative Defendants reference) track city lines. Quite the opposite, they both intrude substantially into the city of Greensboro. Roughly 36,000 of the inhabitants of Enacted 2017 District 61 (almost half of the district's population) reside within the Greensboro CDP limits. The majority of people (51,747 out of 80,732) living in Enacted 2017 District 62, live within Greensboro. In contrast, for both the Recommended and Draft Plans, 80 percent of the district's inhabitants are outside of

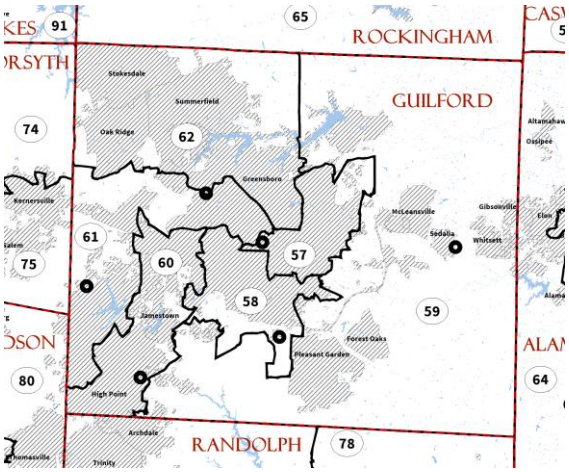
the Greensboro CDP (65,385 out of 81,899 for the Recommended Plan, and 72,946 out of 82,023 for the Draft Plan).[9]

Third, the Legislative Defendants argued that the Draft Plan created less compact districts in Greensboro. Defendants Reply Brief, at 3 ECF No. 218. While mere visual examination suggests this criticism seems misplaced, a plan could be created with higher compactness scores for the Reock and Polsby-Popper measures preferred by the Court, while also remedying the constitutional problems with Enacted 2017 House District 57 and redrawing as few districts as possible. The Recommended Plan, thereby, complies with the Court's Order to "draw districts that are more compact than the 2011 Enacted Districts, using as a guide the Reock ('dispersion') and Polsby-Popper ('perimeter') scores." Order at 8. Whereas the average Reock and Polsby-Popper scores for the Enacted 2011 Guilford County Districts were .36 and .19, respectively, the averages for the Recommended Plan are .38 and .26 (which is roughly the same as the Enacted 2017 Plans). Compactness scores for a majority of the Guilford County districts in the Recommended Plan are now superior to those in both the Enacted 2011 and Enacted 2017 Plans.

The final criticism lodged by the Legislative Defendants against the Draft Plan was that it engaged in racial targeting. That criticism was unfounded with respect to the Draft Plan, and remains so with the Recommended Plan. The race-neutral criteria that animated both plans are apparent on their face. By replacing Enacted House District 57 with Recommended House Districts 57 and 61, the plan remedies the perceived constitutional infirmity that arises from Enacted 2017 House District 57's tracking of the African American population in eastern

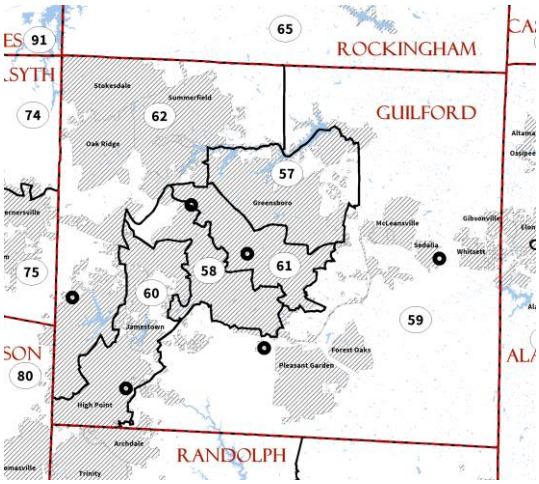
[9] For some reason, the Legislative Defendants also suggest that the "Special Master gave less consideration to Greensboro municipal lines in House District 57." Defendants Reply Brief at 3, ECF No. 218. I confess, I do not understand the criticism. Draft District 57 followed the municipal lines of Greensboro. It contained (and tracked) some of the non-contiguous portions of Greensboro that are northeast of the central city, but Enacted 2017 District 57 did so as well.

Greensboro. It does so by drawing compact, horizontal districts going east-west, made of complete precincts, rather than following the reverse L-shaped pattern of the Enacted 2017 Districts. Recommended House District 57 has a BVAP of 38.4% and Recommended House District 61 has a BVAP of 40.3%. They achieve these levels not through intentional targeting, but through an attempt to avoid what the Court suggests are the constitutionally suspect geographic choices made in construction of the 2011 and 2017 districts. These decreases in the African American population are to be expected from a plan that remedies a district judged to be racially predominant.



To be clear, the Special Master considers the Draft House Plan for Guilford County to be one the Court can adopt, and should be considered as an option. However, the Recommended Plan does a better job in satisfying the Court's articulated criteria and in responding to the parties' concerns. The Draft Plan alters more districts than the Recommended Plan in order to fit three districts completely within Greensboro. In doing so, it has lower scores on the Court's preferred compactness measures. However, were the Court to adopt the Draft Plan, it would remedy the perceived constitutional infirmity of the districts in Guilford County.

Per the Court's request in its Order for the Special Master to discuss "issues, or questions which the Special Master believes may arise or which will otherwise aid the Court," Order at 13, the Special Master wants to alert the Court to yet another option to address the issue of incumbency, precinct splits, and municipality splits in northwest Greensboro. The Recommended Plan resolves the incumbency pairing from the Draft Plan in northwestern Greensboro in a compact way that includes all of the Greensboro precincts that follow the CDP lines and that includes Representative Blust's residence and a majority of his constituents under the Enacted 2017 House Plan. One of those precincts straddles both Greensboro and



Summerfield (containing roughly 700 people in the CDP of Summerfield). That precinct is included in Recommended House District 57 because doing so increases the compactness of the district and the plan. However, to avoid one more intrusion over municipal borders, the precinct could be split or it could easily be taken out, with single precinct "trades" occurring between Recommended District 62, 61, and 57. Such a plan is presented below and in Exhibit 10 as the Guilford Alternate House Plan. The Special Master endorses this plan as an alternative to the Recommended Plan. The change was not made in the Recommended Plan, however, because it would lower the compactness scores of the districts and the plan on the Reock and Polsby-Popper measures preferred by the Court.

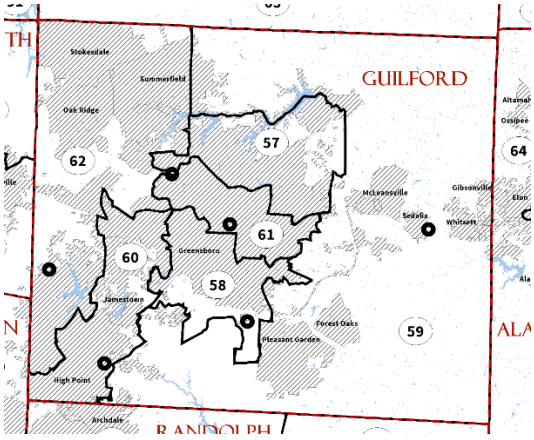
2017 Plan



Special Master's Draft Plan

Special Master's Recommended Plan

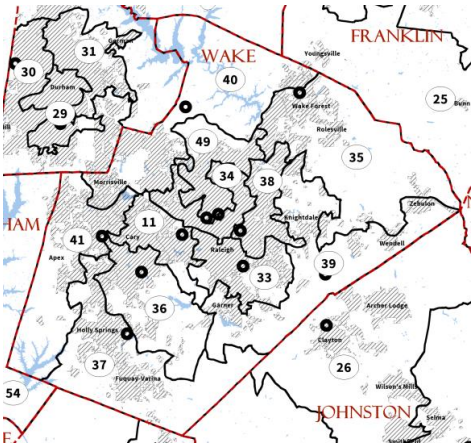
Alternate Plan

Wake County Districts

In Wake County, the Court struck down Enacted 2011 House Districts 33 and 38 as racially predominant in violation of the Equal Protection Clause. 316 F.R.D., at 159-60. Only one of the benchmark districts (i.e., those existing immediately prior to enactment of the 2011 plan) had BVAP percentages over 40 percent. However, the Court found that the Enacted 2011 Plan split municipalities, precincts, communities of interest, and neighborhoods along racial lines to hit a racial target in those districts that exceeded 50 percent. The Court concluded, "[w]hen viewed in light of the strong statewide evidence, it is clear that Defendants drew district boundaries in Wake County with the primary goal of creating two majority-black districts. The district specific evidence supports our finding that race predominated in drawing of House Districts 33 and 38." *Id.*, at 160.

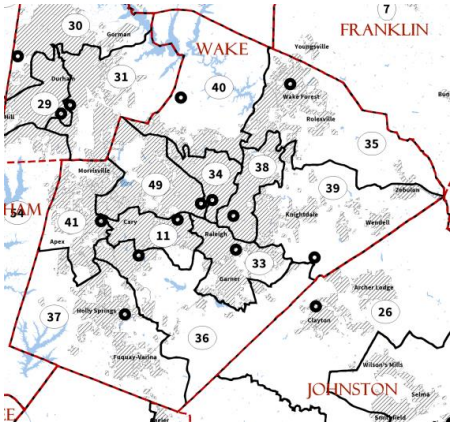
The legal infirmity in the districts in Wake County is characteristically different than those in the previous districts described and therefore requires a different type of remedy. The Court has not called into question any of the 2017 districts that themselves were redrawn to address the racial predominance of their prior incarnations. Rather, the Court has called into question under the North Carolina Constitution the Enacted 2017 Districts that were unnecessarily redrawn to address racial predominance in the Enacted 2011 Districts. In Wake County, the districts deemed unnecessary to be redrawn are 2011 House Districts 36, 37, 40 and 41. By redrawing those districts, which did not adjoin the unconstitutional districts in Wake County, the 2017 Enacted Plan raises concerns for the Court under the provision of the state constitution that prohibits redistricting more than once a decade. *See* N.C. CONST. art. II, §§ 3(4), 5(4).

To address this violation of the state constitution, the Court has ordered the Special Master to recreate the Enacted 2011 House Districts 36, 37, 40 and 41 in their 2011 form. Once redrawn, it becomes necessary to reallocate populations among the districts that did, in fact, adjoin the previously unconstitutional districts. Reinstating these particular 2011 districts, most of which adhere to the western and southern county boundaries, provides an exterior frame within which the reallocation of population must occur. The remaining Enacted 2017 districts are the basemap from which the Special Master's Recommended Plan is created, but significant redrawing must occur in some districts because of the "leftover" territory that remains once the 2011 districts are reinstated. (The task is similar to fitting several square pegs into a round hole – the pegs need to be reshaped if they are going to "fit.")



For the most part, the configurations of the Wake County districts in the Recommended Plan are determined by attaching to each of the Enacted 2017 House Districts the "leftover territory" that exists immediately next to them once the 2011 Districts are reinstated. For example, Enacted 2017 House District 33 moves to the Johnston County border to pick up the territory left there once House District 36 reassumes its 2011 form. Because Recommended House District 33 moves southeast to the border, Recommended District 11 must fill in the "gap" left behind by both 33 and 36. Once 2011 Enacted House District 40 is recreated, Enacted 2017 District 49 is pushed east and Enacted 2017 District 34 is pushed north to assume their form in the Recommended Plan. Enacted 2017 Districts 38 and 39 are kept completely intact, while Enacted 2017 District 35 undergoes very minor alterations to respond to the recreation of Enacted 2011 House District 40.

Per the Court's instruction, the Recommended Plan for Wake County is far superior on compactness scores and precinct splits to the 2011 Enacted Plan. Recreating the 2011 Districts –



some of which were noncompact and split precincts – will naturally increase the number of precinct splits and decrease (just slightly) the compactness scores of the Recommended Plan as compared to the 2017 Enacted Plan. Altering only the districts necessary to remedy the identified state constitutional problems with the Enacted 2017 Districts, while reinstalling the Enacted 2011 Districts, leaves limited options for reconfiguring the districts. This is a virtue, not a vice, of the Court's Order, the principles from which largely determine the reconfiguration of the districts in Wake County.

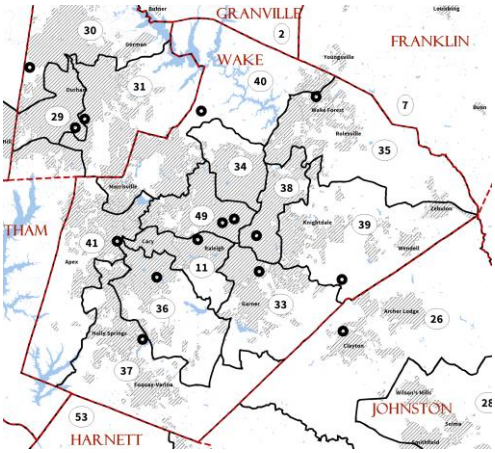
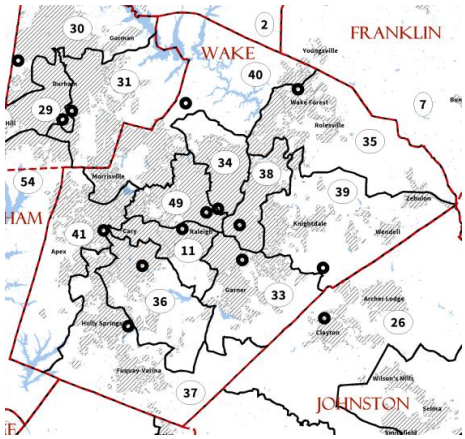
Explanation of Changes from the Draft House Plan to the Recommended House Plan for Wake County

In response to Plaintiffs' suggestions related to the incumbent pairing in the Draft Plan, the Recommended Plan makes minor changes. These involve a swap between Draft House Districts 34 and 49, to unpair the two incumbents there, while ensuring that Recommended House District 41 complies with the Court's Order that it retain its configuration under the Enacted 2011 Plan. The Recommended Plan adopts these minor revisions because they do not undermine the other features of the plan, and as a result, no incumbents are then paired in the Recommended House Plan.



The suggested change is explained in full in Plaintiffs' Response and Proposed Modification to the Special Master's Draft Plan included in Exhibit 8. Representatives Cynthia Ball and Grier Martin were both paired in Draft House District 49. They are easily unpaired by moving Draft District 34 south to pick up the precincts between its border and Representative Martin's residence, and then compensating by moving two nearby precincts into District 49. This can be done while also ensuring that Enacted House District 40 is restored to its 2011 version. This modification ensures that no incumbents are paired in the Special Master's Recommended House Plan.

North Carolina House: Wake County Comparisons with Draft Plan



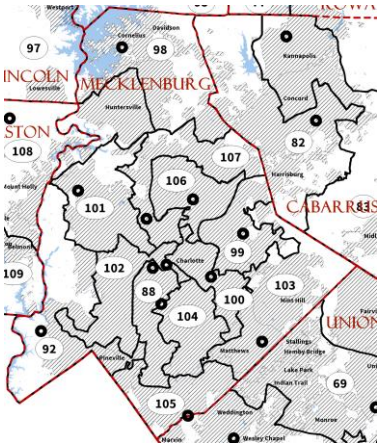
2017 Plan

Special Master's Draft Plan

Special Master's Recommended Plan

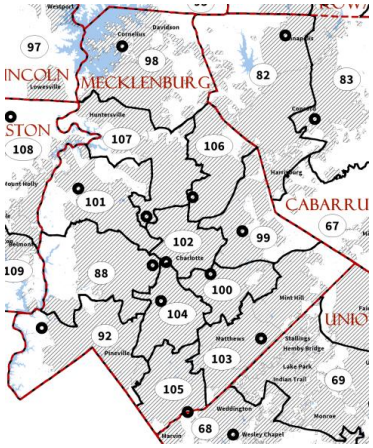
Mecklenburg County Districts

In Mecklenburg County, the Court struck down Enacted 2011 Districts 99, 102, and 107 as unconstitutional racial gerrymanders. The Court found that the legislature had increased the BVAP percentages over the benchmark plan so as to intentionally create majority-minority districts. It did so by drawing districts that tracked the precincts with significant African American population shares and even broke precincts in order to fulfill that goal. *See* 316 F.R.D. at 164-65.



The Court, however, does not harbor any suspicions about residual racial predominance in any of those districts. Rather, the legal problem to be solved in Mecklenburg, as in Wake, concerns the districts that were unnecessarily redrawn to deal with the constitutional infirmity in the Subject Districts. Because the Court ordered only the recreation of 2011 Enacted House District 105, which exists in the southernmost corner of Mecklenburg County, only three additional districts, which border it, needed to be redrawn.

Once Enacted 2011 House District 105 is recreated, Districts 92, 103, and 104 need to be redrawn to fill in the space vacated as 105 retreats to the border. The Recommended House Plan for Mecklenburg County makes the minimum changes necessary to address the state constitutional problem identified by the court. Each of those districts from the Enacted 2017 Plan then converges on the northern border of Enacted 2011 District 105. As District 105 moves south, Districts 92, 103, and 104 move into the territory closest to each one of those districts. The exact configurations are determined by a decision to keep precincts whole (outside of those already split by 2011 Enacted District 105), to keep the districts in the area relatively compact and contiguous, and to make only the changes necessary to remedy the constitutional violation.



The precincts in this area of Mecklenburg County are themselves quite noncompact so any remedial plan, limited to these three districts, will have lower compactness scores than their predecessor districts. The recreation of 2011 Enacted District 105, which is less compact than 2017 Enacted District 105, also inevitably affects the compactness of its adjoining districts.

CONCLUSION

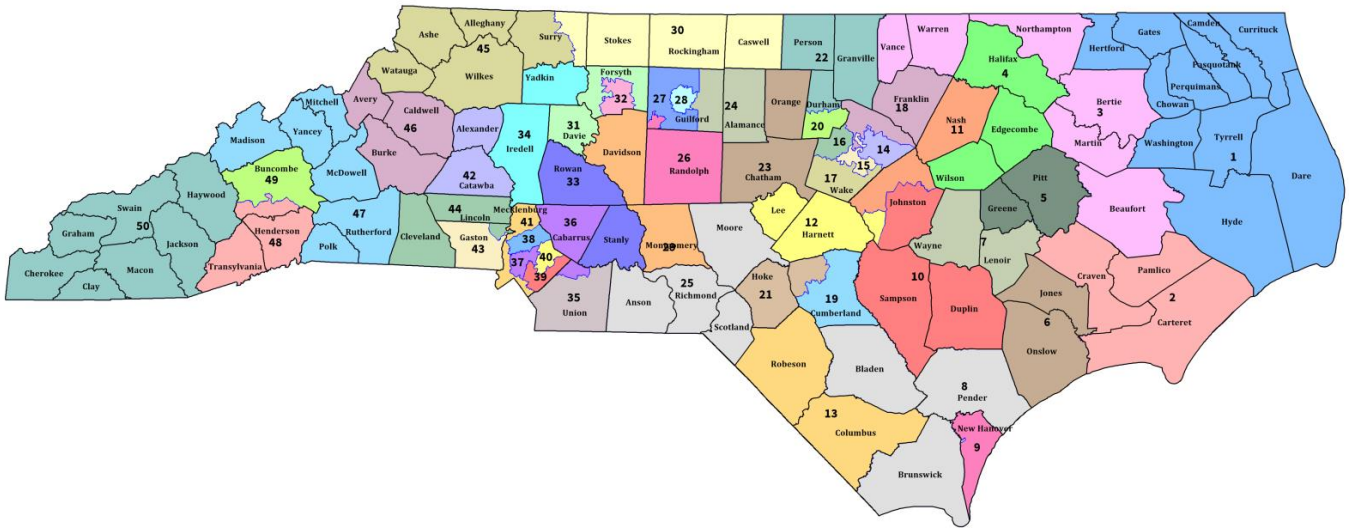
The Special Master's Recommended Plans for the North Carolina Senate and House of Representatives eliminate all of the constitutional infirmities the Court has identified in the plans enacted by the North Carolina General Assembly in 2017. The Court has appointed the Special Master to solve specific and identified problems in the existing state redistricting plans. The Recommended Plans do so. They represent a limited response to a select number of districts that require alteration to comply with the law.

The role a Special Master serves in a redistricting dispute is determined by the purpose for which he or she is appointed. In this case, it was to provide an available remedy for identified violations of the Equal Protection Clause of the Fourteenth Amendment to the United States Constitution and of the North Carolina Constitution's prohibition on redistricting more than once a decade. At times, the Legislative Defendants have asked the Special Master to advocate on their behalf or to speak for the Court. *See* Legislative Defendants' Response to Special Master's Draft Report, at 2, 5, 11, 12, ECF No. 215. The Special Master declines both of those invitations. Even on the expedited schedule in the present case (as in many redistricting cases, given the election calendar), there will be ample time for the parties to present arguments

regarding the Court's evaluation of the 2017 Enacted Plans for the North Carolina Senate and House of Representatives.

With this Report and Plan, the Special Master has provided the Court with redistricting plans that satisfy the criteria stated in the Order. The Recommended Districts solve the legal problems the Court has identified, while complying with one person, one vote, promoting compactness, reducing precinct splits, following municipal lines, and avoiding almost all pairings of incumbents. With the Draft Plan and other alternatives, the Special Master has also provided options to the Court should it wish to strike the balance among the criteria in the Order in a different way than done with the Recommended Plans. If, with the benefit of a hearing and additional briefing, the Court requires modification of the Recommended Plan, the Special Master stands ready to provide additional assistance.

SUBMITTED, this the 1st day of December, 2017.



Nathaniel Persily
Special Master

SPECIAL MASTER'S CORRECTED DRAFT PLAN AND ORDER

On November 1, 2017, the United States District Court for the Middle District of North Carolina appointed me as Special Master in the above captioned case. (Doc. 206) In the order appointing a Special Master, the Court expressed "serious concerns" with the redistricting plans for the North Carolina Senate and House of Representatives passed by the General Assembly on August 31, 2017 ("2017 plans"). The Court ordered the Special Master to develop, by December 1, 2017, redistricting plans that addressed these concerns, which related to the 2017 plans' potential violations of the United States and North Carolina Constitutions.

Provided herein are draft redistricting plans and summary explanations of the principles that guided their creation. The Special Master is releasing these draft plans in the immediate wake of the defendants identifying, also pursuant to the November 1st order, the residences of incumbents who will be running for reelection. As described further below, these draft plans are provided at this early date to give the parties time to lodge objections and to make suggestions, as to unpairing incumbents or otherwise, that might be accommodated in the final plan to be delivered to the Court by December 1. Accompanying the final plan will be a report providing greater detail as to the plan's compliance with applicable law, a more complete explanation of

the rationale for the Special Master's Plan, and evaluation of the plan according to the metrics required by the Court's order. The shapefiles and census block equivalency files for these draft plans have been provided to the Court through its public ECF system. Statewide maps of the Special Master's Draft Plan are attached at the end of this document.

The Charge to the Special Master

The Court has ordered the Special Master to develop a plan that remedies specific legal violations in a limited number of districts. It has not empowered the Special Master to develop a redistricting plan for the entire state, nor has it authorized the Special Master to exercise unbounded discretion in order to remedy the unconstitutional districts. Rather, the Court has ordered the Special Master to redraw Enacted 2017 State Senate Districts 21 and 28 and State House Districts 21 and 57 in order to remedy those districts' violation of the Equal Protection Clause of the Fourteenth Amendment. It has also ordered redrawing of Enacted 2017 State House Districts 36, 37, 40, 41, and 105 because the General Assembly, in redrawing those districts in the 2017 Plan, may have violated the provision of the North Carolina State Constitution prohibiting redistricting more than once a decade.

In formulating a remedial plan, the Special Master is constrained by the applicable law and redistricting principles that guide remedial plans of this type. In its November 1st Order, the Court set forth the principles that would define the Special Master's plan:

a. Redraw district lines for the Subject Districts and any other districts within the applicable 2017 county grouping necessary to cure the unconstitutional racial gerrymanders. As to House District 57, the redrawn lines shall also ensure that the unconstitutional racial gerrymanders in 2011 Enacted House Districts 58 and 60 are cured. As to 2011 Enacted House Districts 33, 38, 99, 102, and 107, no 2011 Enacted House Districts which do not adjoin those districts shall be redrawn unless it is

necessary to do so to meet the mandatory requirements set forth in Paragraphs 2(b) through 2(e) of this Order, and if the Special Master concludes that it is necessary to adjust the lines of a non-adjoining district, the Special Master shall include in his report an explanation as to why such adjustment is necessary.

b. Use the 2010 Federal Decennial Census Data;

c. Draw contiguous districts with a population as close as possible to 79,462 persons for the House Districts and 190,710 persons for the Senate Districts, though a variance up to +/- 5% is permitted and authorized if it would not conflict with the primary obligations to ensure that remedial districts remedy the constitutional violations and otherwise comply with state and federal law, would enhance compliance with state policy as set forth in subsection (f) below, and would not require redrawing lines for an additional district.

d. Adhere to the county groupings used by the General Assembly in the 2017 Enacted Senate and House Plans;

e. Subject to any requirements imposed by the United States Constitution or federal law, comply with North Carolina constitutional requirements including, without limitation, the Whole County Provision as interpreted by the North Carolina Supreme Court.

f. Make reasonable efforts to adhere to the following state policy objectives, so long as adherence to those policy objectives does not conflict with the primary obligations of ensuring that remedial districts remedy the constitutional violations and otherwise comply with state and federal law:

   i. Split fewer precincts than the 2011 Enacted Districts;

   ii. Draw districts that are more compact than the 2011 Enacted Districts, using as a guide the minimum Reock ("dispersion") and Polsby-Popper ("perimeter") scores identified by Richard Pildes & Richard Niemi, Expressive Harms, "Bizarre Districts," and Voting Rights: Evaluating Election-District Appearances After Shaw v. Reno, 92 Mich. L. Rev. 483 (1993); and

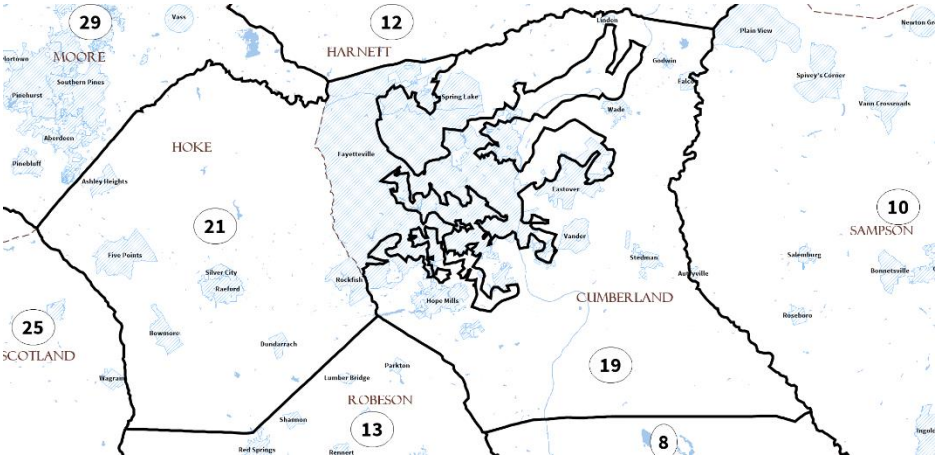
   iii. Consider municipal boundaries and precinct lines.

g. After redrawing the districts, in view of the policy decision by the General Assembly that efforts to avoid pairing incumbents are in the interest of North Carolina voters, the Special Master may adjust district lines to avoid pairing any incumbents who have not publicly announced their intention not to run in 2018, but only to the extent that such adjustment of district lines does not interfere with remedying the constitutional violations and otherwise complying with federal and state law. Additionally, the Special Master shall treat preventing the pairing of incumbents as "a distinctly subordinate consideration" to the other traditional redistricting policy objectives followed by the State. Ga. State Conf. of NAACP v. Fayette Cty. Bd. of Comm'rs, 996 F. Supp. 2d 1353, 1363 (N.D. Ga. 2014) (collecting cases).

h. Except as authorized in Paragraph 2(g), the Special Master shall not consider incumbency or election results in drawing the districts.

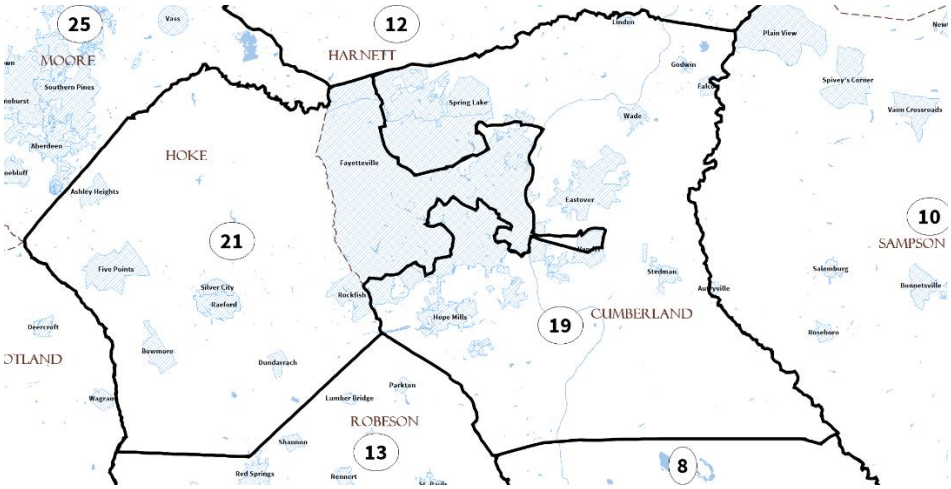
Underlying the Court's prohibition on examining election returns or prioritizing incumbency is reliance on a bedrock principle that the Special Master's Plan shall be constructed in a nonpartisan fashion. This is not to say that the plan will not have partisan, incumbency-related, or other electoral effects – all redistricting plans do. Rather, the principles that guide the production of the plan must be nonpartisan in nature and the changes to the districts must be explainable on that basis. The Special Master's Draft Plan was drawn without consideration of the location of incumbents' residences, so that the incorporation of incumbency in the final plan can be achieved on a nonpartisan basis. As explained further in the order at the conclusion of this document, the parties are asked to propose alterations to the Special Master's Draft Plan to incorporate incumbency. However, the final plan will only accommodate such changes if they do not degrade the underlying features of the plan as expressed in the Court's November 1st Order.

Summary Explanation of Districts in the Special Master's Draft Plan



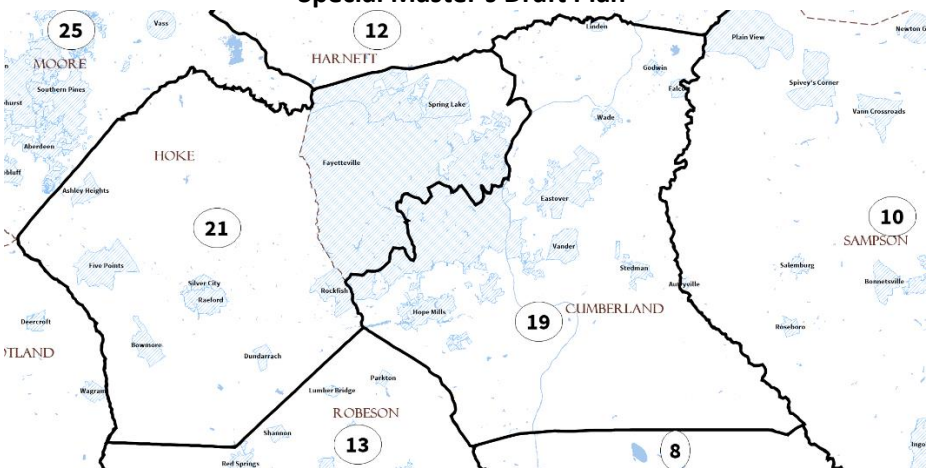
Senate Districts 19 and 21

The Court struck down District 21 in the 2011 Senate Plan as a violation of the Fourteenth Amendment's prohibition on excessive race consciousness in districting. The Court continues to have serious constitutional concerns with the district as redrawn in 2017. The Special Master's Draft Plan attempts to remedy the suspected constitutional infirmity by removing any residuum of racial predominance that may have been expressed in the 2017 configuration of the district.



As newly drawn in the Special Master's Draft Plan, District 21 is a compact district spanning Hoke and Cumberland counties. By moving north and taking in Spring Lake, District 21 avoids the jutting arm into Fayetteville that characterizes the 2017 version of the district. It is constructed of whole precincts – not a single one is divided in the construction of this district. It takes in the entire town of Spring Lake (as defined by the boundaries identifying it as a "Census Designated Place" or CDP) and just enough of Fayetteville so as to comply with one person one vote. The boundaries of the district are determined by the shape of the precinct boundaries.

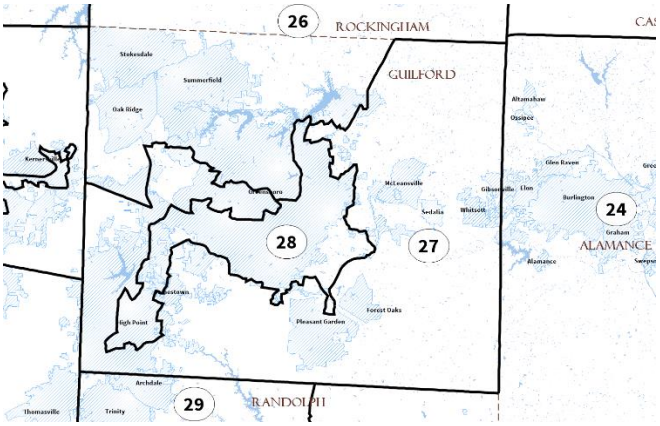
North Carolina Senate: Hoke and Cumberland Counties



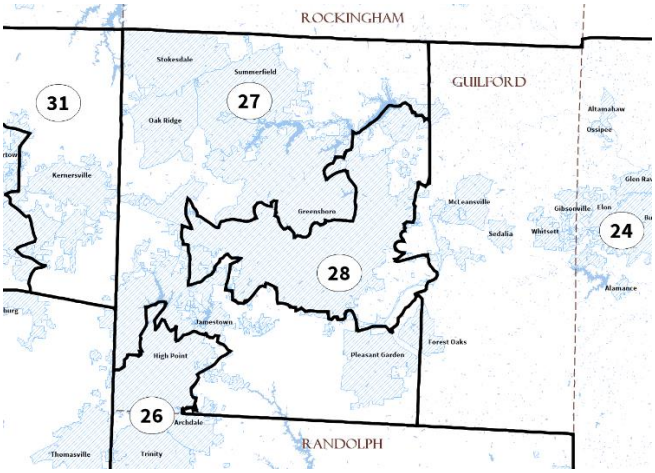
2011 Plan

2017 Plan

Special Master's Draft Plan

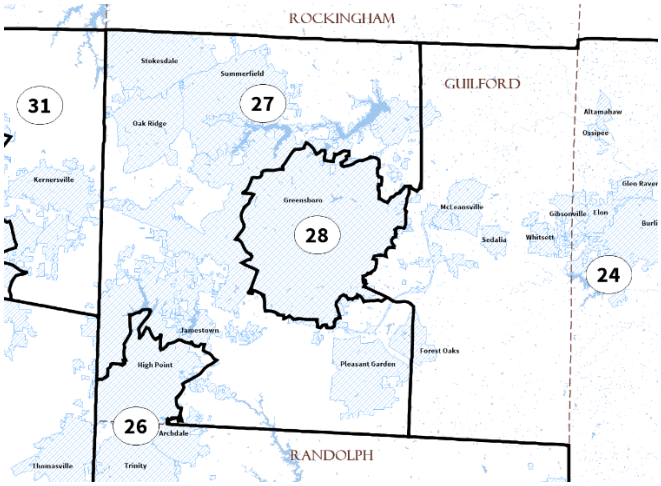


Senate District 28 and the surrounding districts in Guilford County



For similar reasons explained above as to District 19, the Court struck down the 2011 version of Senate District 28 and continues to harbor constitutional concerns as to racial predominance with regard to the district's 2017 configuration. As expressed in the Special Master's draft plan, the newly configured district is a compact district -- almost a perfect circle, which is the shape privileged by the Roeck and Polsby-Popper compactness measures features in the Court's Order. The newly drawn district is contained almost completely within the city (CDP) of Greensboro, and is made up of whole precincts. 2017 Enacted District 26 remains untouched, per the Court's order that the Special Master's Plan may only alter districts necessary to remedy the legal infirmity of the subject districts. District 24 is slightly changed by moving west to the Greensboro CDP border to accommodate the new boundaries of District 28. District 27 "retreats" from most of central Greensboro so as to contain much of the outskirts of Greensboro along with nearby towns of Summerfield, Oak Ridge and Stokesdale.

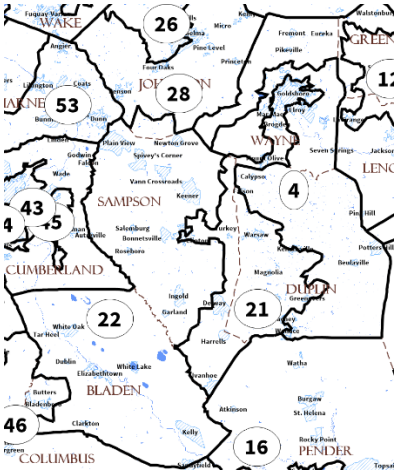
North Carolina Senate: Guilford County



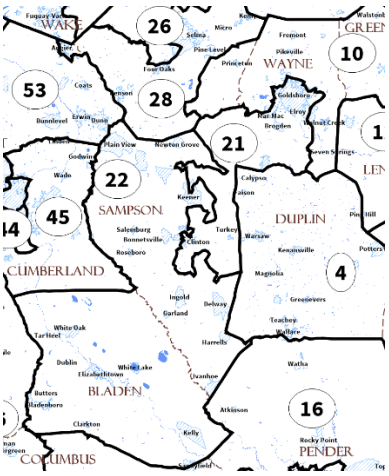
2011 Plan

2017 Plan

Special Master's Draft Plan

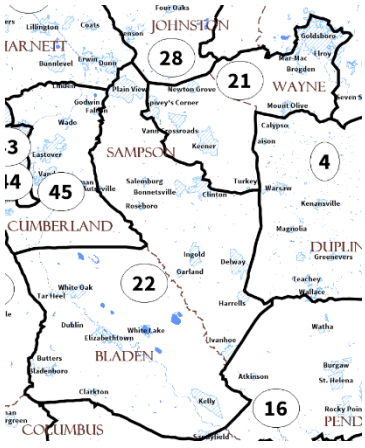


House Districts 21 and 22



As with the Senate Districts described above, the Court struck down House District 21 as a violation of the Equal Protection Clause of the Fourteenth Amendment. Because of the district's continued non-compactness, the Court's concerns as to excessive race-consciousness appear to remain in Enacted 2017 District 21. The Special Master's Draft Plan addresses this lack of compactness by smoothing out the border in Sampson County, thereby avoiding the selective inclusion of heavily African American precincts that characterized the 2011 and 2017 versions of the district. The District continues to retain its configuration in Wayne County, which is principally defined by the boundaries of Goldsboro. Because Districts 21 and 10 approach the upper limit (exactly five percent deviation) of what is permissible under one-person, one-vote, a few precincts needed to be split in Sampson, but are configured in such a way as to maximize the compactness of the district.

North Carolina House: Bladen, Sampson and Wayne Counties



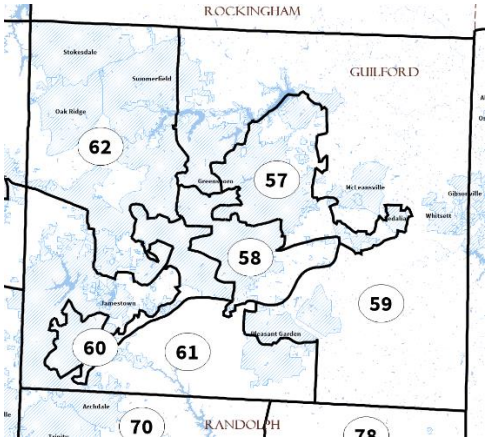
2011 Plan

2017 Plan

Special Master's Draft Plan

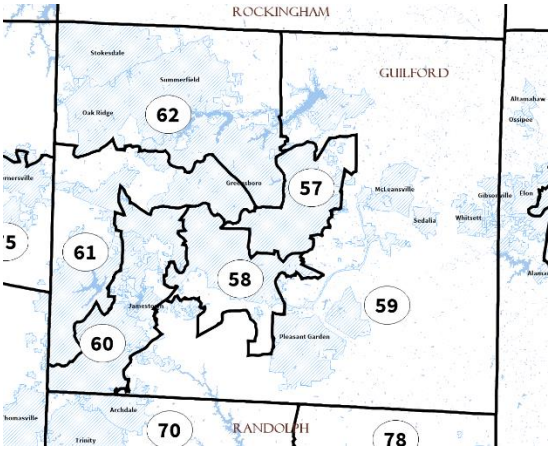
House District 57 and Surrounding Districts in Guilford County

The Court continues to harbor concerns as to the constitutionality of Enacted 2017 House District 57. Because the District retains a backwards "L shape" along the eastern side of Greensboro, according to the Court, it perpetuates the racial predominance of its predecessor district by over-concentrating the African American population in the area. The Special Master's Draft Plan addresses the legal infirmity in this district by moving the district north and west so as to create a compact district in north Greensboro.



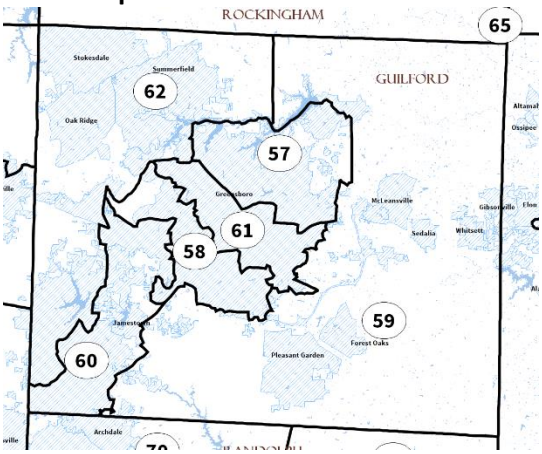
The directions from the Court with respect to redrawing this district are more specific than for others in the remedial plan. "As to House District 57," the Court's Order directs, "the redrawn lines shall also ensure that the unconstitutional racial gerrymanders in 2011 Enacted House Districts 58 and 60 are cured." This direction presents additional constraints as to how the districts adjoining District 57 must be drawn. In particular, there is a danger that once District 57 moves north, that the districts below it will move north and assume a similar configuration to those struck down in the 2011 plan. In addition, because District 60 does not abut the Subject District and therefore need not be redrawn, it places a "floor" that determines the shape of the remaining districts in Greensboro.

Districts 58 and 61 in the Special Master's Draft Plan, therefore, move from southeast to northwest, but remain entirely within the CDP of Greensboro. Their configuration is determined by four factors: (1) avoiding replication of the constitutional defects in the analogous 2011 districts; (2) staying within the boundaries of Greensboro, (3) not altering the boundaries of District 60, and (4) doing so by not splitting any new precincts with the redrawn districts. District



59 retains most of its current configuration, except that it now more closely "hugs" the southern border of Greensboro. Because newly redrawn District 57 moves northwest, it "pushes" District 62 west and south along the border with Forsyth County thereby taking up the territory there that had been included in 2017 Enacted District 61.

North Carolina House: Guilford County

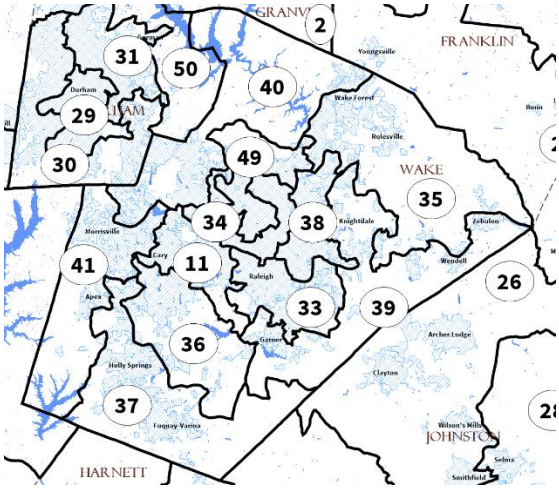


2011 Plan

2017 Plan

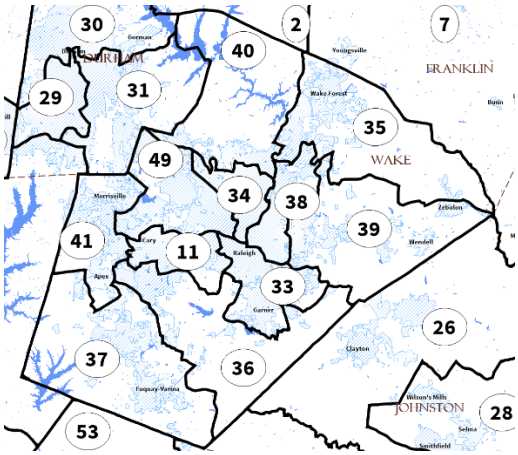
Special Master's Draft Plan

Wake County Districts



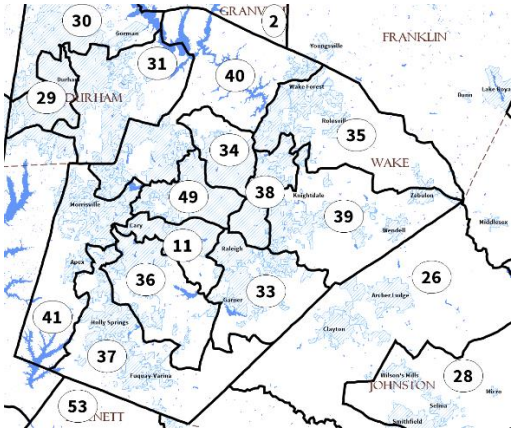
The legal infirmity in the districts in Wake County and Mecklenburg County is characteristically different than those in the previous districts described and therefore requires a different type of remedy. The Court has not called into question any of the 2017 districts that themselves were redrawn to address the racial predominance in their prior incarnation. Rather, in those two counties, the Court has called into question under the state constitution the 2017 Enacted Districts that were unnecessarily redrawn to address constitutional infirmities as to racial predominance in several of the 2011 Enacted Districts. In Wake County, the districts deemed unnecessary to be redrawn are 2011 House Districts 36, 37, 40 and 41. By redrawing those districts, which did not adjoin the unconstitutional districts in Wake County, the plan raises concerns for the Court under the provision of the state constitution that prohibits redistricting more than once a decade.

To address this violation of the state constitution, the Court has ordered the Special Master to recreate the 2011 House Districts 36, 37, 40 and 41. Once redrawn, it becomes necessary to reallocate populations among the districts that did, in fact, adjoin the previously unconstitutional districts. Reinstating the old districts, most of which adhere to the county boundary, provides an exterior frame within which the reallocation of population must occur. The remaining Enacted 2017 districts are the basemap from which the Special Master's Draft Plan is created, but significant redrawing must occur in some districts because of the "leftover" population that remains once the 2011 districts are reinstated. For the most part, the configurations of the districts are determined by moving District 33 to the county border and then shifting the remaining interior districts clockwise until they achieve population equality. By reinstating the 2011 districts, several precincts are now split that were not under the 2017 plan.



However, the Special Master's Draft Plan does not add any more split precincts and in, fact, recombines some precincts that were split with the 2011 or 2017 plan.

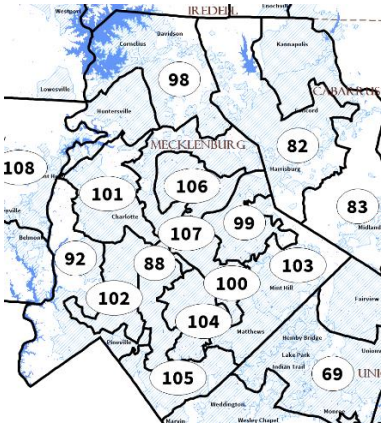
North Carolina House: Wake County



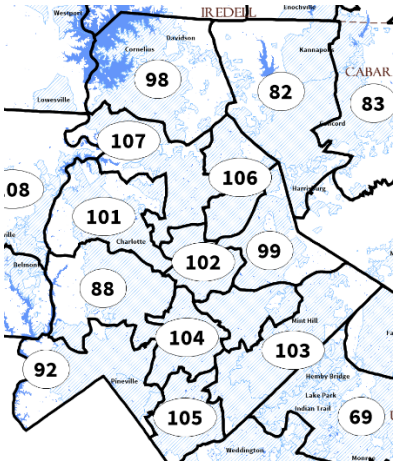
2011 Plan

2017 Plan

Special Master's Draft Plan



Mecklenburg County Districts



The dynamic in Mecklenburg County is the same as in Wake, but fewer districts need to be redrawn to address the 2017 Enacted Plan's violation of the state constitution. Only 2017 Enacted District 105 raised concerns for the Court and needs to be reinstated. As a result, only 2017 Enacted Districts 92, 103, 104, and 105 need to be redrawn to cure the state constitutional violation. As District 105 moves south, Districts 92, 103, and 104 move into the territory closest to each one of those districts. The exact configurations are determined by a decision to keep precincts whole (outside of those already broken by 2011 Enacted District 105), to keep the districts in the area relatively compact and contiguous, and to make only the changes necessary to remedy the constitutional violation.

Special Master's Draft Plan

ORDER

1. The parties are ordered to submit to the Special Master proposed objections and revisions to the Special Master's Draft Plan by November 17, 2017. Briefs are limited to 25,000 words. In particular, the parties are encouraged to include in these submissions suggestions as to how incumbents shall be unpaired without degrading the underlying features of the plan, as specified in the Court order. The parties shall also then specify any disagreements they have as to which incumbents are seeking reelection in 2018. Reply briefs shall be submitted by November 21, 2017 and shall not exceed 10,000 words. In their replies, the parties are encouraged to identify which proposed changes of the plaintiffs and defendants, if any, are jointly supported by the parties.
2. The parties are further ordered to supply to the Special Master by November 14, 2017, in electronic form, a geographic layer to be incorporated into Maptitude for Redistricting, that includes and identifies the location of the residences of all current incumbents in the North Carolina General Assembly.

SO ORDERED, this the 13th day of November, 2017.

/s/
Nathaniel Persily
Special Master

Exhibit 8

IN THE UNITED STATES DISTRICT COURT
FOR THE MIDDLE DISTRICT OF NORTH CAROLINA

SANDRA LITTLE COVINGTON, *et al.*, Plaintiffs, v. THE STATE OF NORTH CAROLINA, *et al,* Defendants.	No. 1:15-cv-399

PLAINTIFFS' RESPONSE AND PROPOSED MODIFICATIONS TO THE SPECIAL MASTER'S DRAFT PLAN

Plaintiffs have carefully analyzed the Special Master's Draft Plan (hereinafter, "Draft Plan") and have concluded that the plan does remedy the constitutional flaws in the legislature's 2017 enacted plan. Because the Special Master has invited "suggestions as to unpairing incumbents or otherwise," ECF 212 at 1, Plaintiffs here offer some suggestions to unpair incumbents, and a few other slight proposed revisions to the Draft Plan. Such suggestions are offered only where, in accordance with the Court's and Special Master's instructions, those modifications take into account the state's legislative policy preferences as expressed in the state's adopted redistricting criteria, see ECF 212 at 3, and "do not degrade the underlying features of the plan as expressed in the Court's November 1st order." ECF 212 at 4.

I. House Districts 57 and Surrounding Districts in Guilford County

Plaintiffs' analysis of the proposed changes to House Districts in Guilford County indicates that the racial gerrymandering has been cured. However, the reconfigured

districts do pair two sets of incumbents: African-American Democrat Amos Quick, currently representing House District 58, and White Republican Jon Hardister, currently representing House District 59, are paired in Draft Plan House District 59; White Democrat Pricey Harrison, currently representing House District 57, and White Republican John Blust, currently representing House District 62, are paired in Draft Plan House District 61. Districts 57 and 58 in the Draft Plan are left with no incumbent.

Plaintiffs believe that Representative Quick and Representative Hardister can be unpaired easily without degrading the underlying features of the plan. Representative Quick lives in Precinct SUM2, which is immediately adjacent to Draft Plan House District 58, which has no incumbent. There are two options for moving Representative Quick to open District 58:

(1) Rep. Quick's entire precinct could be added to HD 58. This change would not make HD 59 or HD 58 over- or under-populated.

(2) Rep. Quick lives at the northern end of Precinct SUM2, closer to the border with HD 58, so the precinct could be split to add only the top portion of SUM2 to HD 58.

Moving the entire precinct SUM2 to HD 58 does make HD 58 less compact than it is in the Draft Plan, but it is still within acceptable compactness ranges and much more compact than districts in the 2011 Plan.[1] Splitting the SUM2 precinct would make HD

[1]In the Draft Plan, HD 58 scores 0.27 on Reock and 0.15 on Polsby-Popper. Plaintiffs' proposed version of HD 58 that moves the entire SUM2 precinct scores 0.23 on Reock and 0.13 on Polsby-Popper. Thus, the Plaintiffs' Proposed whole-precinct modification

58 more compact—comparable to the version in the Draft Plan[2]—but it would split a precinct where the Draft Plan in Guilford County currently split no precincts. In Plaintiffs' view, both options are acceptable—neither significantly degrades the underlying plan in terms of compactness or respect for precincts and municipal boundaries. Plaintiffs offer both options to the Special Master—the maps presented in Exhibit A (the whole precinct map is at page 1 and the split precinct map is at page 2) and the shapefiles being served via email—but express no preference in terms of which option best complies with the Court's directives to the Special Master.

II. Wake County Districts

Plaintiffs propose two small modifications to the Wake County Districts in the Special Master's Draft Plan. First, and most importantly, Plaintiffs have observed an apparently inadvertent violation of the North Carolina Constitution's prohibition on mid-decade redistricting. The Special Master was instructed by the Court to "recreate the 2011 House Districts 36, 37, 40 and 41" because the modification of those districts in the 2017 plan exceeded the court's order to remedy the two districts found to be racial gerrymanders. ECF 212 at 14 (Special Master's Order on Draft Plan); *see also* ECF 206 at 2-3 (Court's Order Appointing Special Master). It appears that the Draft Plan

---

is slightly less compact than the Draft Plan, but not in a way that degrades the plan in any significant way.

[2] In the Draft Plan, HD 58 scores 0.27 on Reock and 0.15 on Polsby-Popper. Plaintiffs' proposed version of HD 58 that adds only the northern part of precinct SUM2 scores 0.24 on Reock and 0.14 on Polsby-Popper. Plaintiffs' proposed split-precinct modification is thus more compact than the whole-precinct modification, and essentially comparable to the Special Master's Draft Plan version of the district.

inadvertently makes one precinct whole that was split in the 2011 version of HD 40. *See* Ex. A at 3. That is precinct 08-10, which is split in the 2011 version of HD 40 but is whole in the Draft Plan version of HD 40. Plaintiffs recommend slightly modifying the Draft Plan's version of HD 40 to restore it entirely to its 2011 version, including that split precinct. Significantly, restoring HD 40 to its 2011 form has ripple effects on at least two additional districts—certainly HD 49 and potentially HD 34. Splitting the precinct in HD 40 means that population is moved to HD 49, which then becomes overpopulated, and some population must be moved to an adjacent district. HD 34 is an obvious choice to receive that additional population from HD 49. The other districts that were to be restored to their 2011 versions (36, 37 and 41) have been perfectly restored.

Second, in the Draft Plan, two incumbents are paired. Democrat Cynthia Ball, currently representing House District 49, and Democrat Grier Martin, currently representing House District 34, are now paired in Draft Plan House District 49, while House District 34 is left with no incumbent. Representative Martin lives in Precinct 01-10, which is near the edge of Draft Plan District 49, making it easy to move him out of that district. Plaintiffs' proposed modification moves only six precincts between the two affected districts—Precincts 07-03 and 07-09 are moved from District 34 to District 49, and Precincts 01-10, 01-11, 01-12 and 01-36 are moved from District 49 to District 34. These modifications unpair the incumbents, keep the two districts within acceptable population deviations, have no impact on municipal boundary splits, do not split any precincts, and create two districts that are comparably compact to the same two districts

in the Draft Plan.[3] The two districts are maintained in the same region and retain the same general shape as they have in the Draft Plan. The map displaying Plaintiffs' proposed modifications to Wake County House Districts is can be seen in Exhibit A at page 4.

III. Plaintiffs Make No Suggested Changes to the Following Districts

A. Mecklenburg County – HD 92, 103, 104, and 105

Plaintiffs' analysis of the proposed changes in this county in the Draft Plan indicates that the racial gerrymandering has been cured and that no incumbents intending to run in 2018 are paired by the configuration of the districts. Thus, Plaintiffs lodge no objections or proposed modifications to House Districts 92, 103, 104, and 105 in the Draft Plan.

B. Guilford County – HD 61

While Plaintiffs are able to recommend changes to the pairing of Representatives Hardister and Quick in Guilford county, *see supra* at Section I, at 1-3, unpairing Representative Blust and Representative Harrison is much more challenging.

[3] The change in compactness scores in HD 49 and 34 cannot be attributed entirely or even predominantly to the unpairing of Representatives Ball and Martin. Both of those districts were modified to accommodate the restoration of HD 40 and even out the population between districts in that area. Notwithstanding that fact, the compactness scores of the districts in the Special Master's plan and the Plaintiffs' suggested revisions are comparable. HD 49 in the Draft Plan scores 0.41 on Reock and 0.33 on Polsby-Popper. HD 49 in the Plaintiffs' Proposed Wake Modification scores 0.46 on Reock and 0.30 on Polsby-Popper. HD 34 in the Draft Plan scores 0.46 on Reock and 0.53 on Polsby-Popper. HD 34 in the Plaintiffs' Proposed Wake Modification scores 0.44 on Reock and 0.43 on Polsby-Popper. Thus, the Special Master's version of HD 34 is only very slightly more compact than Plaintiffs' suggested version, but that may be due to the restoration of HD 40. With HD 49, the Special Master's version scores better on Polsby-Popper and the Plaintiffs' version scores better on Reock. Ultimately, Plaintiffs' suggested modifications do not degrade the compactness of the Special Master's plan.

Representative Blust lives in Precinct FR3, which is at the edge of Draft Plan House District 61 and directly adjacent to House District 62. But moving Representative Blust into that District pairs Rep. Blust with Republican Representative John Faircloth, and has no other added advantages in terms of compactness or municipal boundaries. In addition, based on where Rep. Blust and Rep. Harrison live, it is not possible to move either of them into the open HD 57 without significantly degrading the underlying features of the plan. Thus, it seems like this pairing may be unavoidable, particularly given the fact that the Court has instructed that preventing the unpairing of incumbents is a "distinctly subordinate consideration." ECF 212 at 3.

C. Sampson, Wayne, and Bladen Counties – HD 21 and 22

Plaintiffs' analysis of the proposed changes in this area of the state in the Draft Plan indicates that the racial gerrymandering has been cured and that no incumbents intending to run in 2018 are paired by the configuration of the districts. Thus, Plaintiffs lodge no objections to House Districts 21 and 22 in the Draft Plan nor have any proposed modifications.

D. Cumberland and Hoke Counties – SD 19 and 21

Plaintiffs have no objection or proposed modification to Senate Districts 19 and 21 in the Draft Plan, although there is a potential pairing of Senators Clark (African-American Democrat) and Meredith (White Republican), using Senator Clark's new house in Fayetteville. *See* ECF 208, Ex. 2. Plaintiffs have not been able to create a map that cures

the racial gerrymander, unpairs Senator Clark's new home from Senator Meredith's residence, and maintains the underlying features of the plan.

E. Guilford County – SD 28

Plaintiffs' analysis of the proposed changes to Senate District 28 indicates that the racial gerrymandering has been adequately cured. As with the Senate Districts in Cumberland County, there are two incumbents paired—African-American Democrat Gladys Robinson, currently representing Senate District 28, and White Republican Senator Trudy Wade, currently representing Senate District 27, are paired in Draft Plan Senate District 27.

Plaintiffs have not been able to design a configuration of Senate Districts in this cluster that would both cure the racial gerrymandering in Senate District 28, leave Senate District 26 untouched, *see* ECF 212 at 7, not degrade the underlying features of the plan, and not pair these two incumbents.

CONCLUSION

Therefore Plaintiffs respectfully make the foregoing proposed slight adjustments to the Special Master's draft plan. Shapefiles with these proposed changes are being served upon the parties and the Special Master with the filing of this brief.

Respectfully submitted this 17th day of November, 2017.

IN THE UNITED STATES DISTRICT COURT
FOR THE MIDDLE DISTRICT OF NORTH CAROLINA

SANDRA LITTLE COVINGTON, *et al.*, Plaintiffs, v. THE STATE OF NORTH CAROLINA, *et al,* Defendants.	No. 1:15-cv-399

PLAINTIFFS' RESPONSE TO LEGISLATIVE DEFENDANTS' NOVEMBER 17, 2017 FILING

The Special Master instructed the parties to provide proposed objections and revisions to the Draft Plan and specifically encouraged the parties to include suggestions as to how incumbents should be unpaired. ECF 212 at 19. Legislative Defendants provide only abstract objections, not meaningfully engaging with any element of the Draft Plan, and offer no alternative plan or suggestions for unpairing incumbents for the Special Master's consideration (or upon which Plaintiffs could comment). Indeed, this lack of meaningful response from Legislative Defendants is surprising since a large portion of their brief complains about the absence of another chance to remedy the continued unconstitutionality in the 2017 enacted plan. When presented with an opportunity by the Special Master to do just that, Legislative Defendants declined.

Nonetheless, Plaintiffs submit the following observations to assist the Special Master in completing the task assigned to him.

I. UNDER THE NORTH CAROLINA CONSTITUTION, THE COURT DID NOT AUTHORIZE THE LEGISLATURE TO ENGAGE IN MID-DECADE REDISTRICTING BEYOND THAT WHICH WAS NECESSARY TO REMEDY RACIAL GERRYMANDERING, AND THUS THE SPECIAL MASTER'S MODIFICATIONS ARE APPROPRIATE

Legislative Defendants' continued protestations that the legislature was free to make any changes it saw fit to all Wake and Mecklenburg County House Districts during the 2017 remedial process defies all logic and legal reasoning. A federal court can only authorize a legislature to depart from state constitutional demands insofar as is necessary to correct violations of federal law. *See Cleveland Cnty. Ass'n for Gov't by the People v. Cleveland Cnty. Bd. of Comm'rs,* 142 F.3d 468, 477 (D.C. Cir. 1998) (per curiam) ("[I]f a violation of federal law *necessitates* a remedy barred by state law, the state law must give way; if no such violation exists, principles of federalism dictate that state law governs."). The Court's reading of Article II, Sections 3(4) and 5(4) of the North Carolina constitution is neither "novel," Defs' Br. at 13, nor inconsistent with North Carolina state law precedent. It is difficult to imagine any directive more "clear, complete, and unmistakable," *Kornegay v. Goldsboro*, 180 N.C. 441, 445, 105 S.E. 187, 189 (1920), than the plainly-worded rule that legislative districts "shall remain unaltered until the return of another decennial census." N.C. CONST. art. II §§3(4) and 5(4).

In Wake and Mecklenburg Counties, it is factually incorrect that "the shapes and locations of the non-adjoining districts were directly caused by the location of the illegal districts," Defs' Br. at 13-14, and thus must somehow be altered in correcting the racial gerrymanders. Plaintiffs' proposed maps for these two counties, introduced during the

legislative session and presented to this Court, demonstrate that the racial gerrymanders can be remedied without touching the five implicated districts, and there is no "domino effect" on every district in the county. Defs' Br. at 14. Were the Special Master to suggest to the court that the legislature should have free rein to redistrict county-wide, even where such alterations are not necessary to remedy a federal law violation, then the Court would commit the very errors that were central in *Perry v. Perez*, 565 U.S. 388, 392 (2012), where a federal court erroneously disregarded state law and policy. The Special Master should decline to offer such poor advice.

II. THE AVAILABILITY OR USE OF RACIAL DATA DOES NOT EQUATE TO RACIAL PREDOMINANCE IN REDISTRICTING

Legislative Defendants' only remotely-specific condemnation of the Draft Plan is that the Special Master employed "racial sorting" in the plan. Defs' Br. at 15. As Legislative Defendants should know—after years of litigation over its 2011 maps and three recent United States Supreme Court decisions reiterating the standards for the appropriate use of race—the consideration of race in redistricting does not condemn a plan as an unconstitutional racial gerrymander. *See Bush v. Vera*, 517 U.S. 952, 993 (1996) (O'Connor, J., concurring); *see also Doe v. Lower Merion Sch. Dist.*, 665 F.3d 524, 555 (3d Cir. 2011); *Prejean v. Foster*, 227 F.3d 504, 509 (5th Cir. 2000); *Shirt v. Hazeltine*, 461 F.3d 1011, 1019 (8th Cir. 2006). The use of race in drawing district lines only triggers heightened scrutiny where race is "the predominant factor motivating the [mapdrawer's] decision to place a significant number of voters within or without a particular district." *Ala. Legis. Black Caucus v. Alabama*, 135 S. Ct. 1257, 1267 (2015) (quoting *Miller v. Johnson*,

515 U.S. 900, 916 (1995)) ("*ALBC*"); *see also Cooper v. Harris*, 137 S. Ct. 1455, 1463 (2017); *Bethune-Hill v. Va. State Bd. of Elections*, 137 S. Ct. 788, 794 (2016).

These three recent cases paint a detailed picture of what actually constitutes a mechanical racial target. *See ALBC*, 135 S. Ct. at 1257, 1271 (finding that the "primary redistricting goal [] to maintain existing racial percentages in each majority-minority district" was a mechanical racial target); *Cooper*, 137 S. Ct. at 1468-69 (holding that a prerequisite that certain districts "must include a sufficient number of African-Americans" to make the "majority black district[s]," regardless of the level of racially polarized voting in the region, is a "textbook example of race-based districting") (internal quotations omitted); *Bethune-Hill,* 137 S. Ct. at 802 (ruling that the legislature's predetermination that each district that elected an African-American representative must have, as redrawn, at least 55% black voting age population was, in all but one instance, an unjustified racial target). Contrary to Legislative Defendants' allegations, mechanical racial targets do not exist and predominate in the redistricting process where, in areas of the state with substantial African-American populations, compact districts drawn from whole precincts and respecting political subdivisions might have black voting age populations ranging from 39% to 43.6%. Defs' Br. at 15. This geographically-predictable outcome is neither surprising nor constitutionally suspect. There is no racial gerrymandering or racial sorting in the Draft Plan because there is neither "circumstantial evidence of a district's shape and demographics" that race predominated "or more direct evidence going to [] purpose." *Bethune-Hill,* 137 S. Ct. at 797. In making these specious claims, Legislative Defendants

can point to no evidence that the Special Master "subordinated traditional race-neutral districting principles . . . to racial considerations," because none exists. *Id*.

CONCLUSION

The three-judge panel provided the Special Master with detailed instructions on how to construct a proposed remedial map, *see, e.g.*, Court Order, ECF 206 at 5-13 (detailing, among other things, the data the Special Master was to obtain or refrain from using, the traditional redistricting criteria he was to respect, and many others). The Special Master's Draft Plan evidences that he understood the detailed instructions from the Court and has a firm grasp on compliance with the United States Supreme Court's precedent on racial gerrymandering.

Therefore, Plaintiffs respectfully urge the Special Master to reject Legislative Defendants' broad and abstract objections, make only the proposed slight adjustments proposed by Plaintiffs to the Draft Plan, and otherwise present the Draft Plan to the Court for its consideration in its current form.

Respectfully submitted this 21st day of November, 2017.

Exhibit 9

IN THE UNITED STATES DISTRICT COURT
FOR THE MIDDLE DISTRICT OF NORTH CAROLINA
NO. 1:15-CV-00399

SANDRA LITTLE COVINGTON, *et al.*, Plaintiffs, v. STATE OF NORTH CAROLINA, *et al.* Defendants.	**LEGISLATIVE DEFENDANTS' RESPONSE TO SPECIAL MASTER'S DRAFT REPORT**

INTRODUCTION

Legislative defendants continue to object to the irregular and inappropriate process the Court has adopted in this case. The Court, and therefore, the special master, lack jurisdiction over the districts enacted by the legislature on August 31, 2017 ("2017 plans") because the legislature fully complied with this Court's judgment and the case is now moot.

In any event, none of the special master's proposed districts should be adopted until the Court explains how all of the districts challenged by plaintiffs in their objections ("Subject Districts") fail to remedy constitutional violations and gives North Carolina an opportunity to either correct them or seek appellate review.[1]

[1] The process adopted by the Court for the appointment of the special master violates Rule 53, Fed. R. Civ. P., and the constitutional sovereignty of the State of North Carolina, including its legislature. Legislative defendants incorporate by reference all of their prior objections related to the appointment of Professor Persily as special master. D.E. 204. Legislative defendants renew their request to conduct a deposition or voir dire of the special master to examine the apparent conflicts raised by legislative defendants in prior briefing.

Indeed, absent a definitive ruling from the Court explaining how and why the 2017 Senate Districts 21 and 28 and House Districts 21 and 57 fail to remedy federal constitutional violations found by the Court, the special master has been left to speculate on the criteria that the Court might ultimately approve for redrawing these districts. While it is not completely clear what specific criteria the special master followed because they have not been articulated, it appears that the special master has engaged in racial sorting to establish districts with racial targets for black voting age population ("BVAP") without citing or developing any evidence of legally significant racially polarized voting that might otherwise justify the use of race.[2] Because the special master has considered race—without justification or standard articulated by the Court or by him—in the drawing of his districts, those proposed districts—not the Subject Districts—are racial gerrymanders.

The special master should also recommend that the 2017 plans' changes to House Districts 36, 37, 40, and 41 in Wake County and House District 105 in Mecklenburg County not be enjoined by the Court. Neither the Court nor the special master has

[2] The Supreme Court has made clear that a record must include evidence of statistically significant racially polarized voting *in a specific geographic area* before race can be considered in drawing a district encompassing that area. *Cooper v. Harris*, 137 S.Ct. 1455, 1471 (2017) ("*Harris*"). Indeed, in *Harris* the Supreme Court held that even though the record before the North Carolina General Assembly contained expert reports documenting statewide racially polarized voting, the evidence wasn't sufficiently "local" enough to justify the State's consideration of race in drawing specific districts. *Id*. and n.5. Here, the special master does not even have evidence of statewide racially polarized voting before him, much less evidence of statistically significant racially polarized voting in the districts that he created employing racial sorting. If the State's record evidence in *Harris* was insufficient to support the use of race in redistricting, certainly the complete dearth of any such evidence before the special master prevents him from considering it.

jurisdiction to consider state constitutional claims made against the State of North Carolina, nor may the Court defer addressing the issue of its jurisdiction, once asserted, while it conducts an analysis of the merits of those claims. But, in any case, the special master has modified these districts based upon an erroneous interpretation of the North Carolina Constitution apparently adopted by the Court. Nothing under federal law would prevent the North Carolina General Assembly from adopting completely new, statewide districting plans at any time – much less changing "non-adjoining" districts whose shape and location were directly caused by the placement of the illegal districts. Whether any such action would violate the North Carolina Constitution is a question reserved to the Supreme Court of North Carolina and should not be decided by the special master or the Court.

1. This case is moot.

As previously explained by legislative defendants, this matter is moot and if plaintiffs want to pursue additional claims, they must file a new lawsuit. "[A]n actual controversy must be extant at all stages of review, not merely at the time the complaint is filed." *Arizonans for Official English v. Arizona*, 520 U.S. 43, 67 (1997). "A case is moot when the issues presented are no longer 'live' or the parties lack a legally cognizable interest in the outcome." *City of Erie v. Pap's A.M.*, 529 U.S. 277, 287 (2000) (quoting *County of Los Angeles v. Davis*, 440 U.S. 625, 631 (1979)). Here, the Court has enjoined the use of the 2011 legislative plans and those plans will not be used. Moreover,

the legislature has now enacted new plans for the 2018 elections. There is therefore nothing left for the Court or the special master to do.[3]

Similarly, plaintiffs no longer have a concrete stake in the outcome of the case because they face no realistic threat of injury from the 2011 legislative plans. To maintain a live case or controversy:

> [t]he parties must continue to have a "personal stake in the outcome" of the lawsuit. . . . . This means that, throughout the litigation, the plaintiff "must have suffered, or be threatened with, an actual injury traceable to the defendant and likely to be redressed by a favorable judicial decision."

Spencer v. Kemna, 523 U.S. 1, 7 (1998) (quoting *Lewis v. Continental Bank Corp*., 494 U.S. 472, 477–78 (1990)). For this reason, the doctrine of mootness is often characterized as "the doctrine of standing set in a time frame: The requisite personal interest that must exist at the commencement of the litigation (standing) must continue throughout its existence (mootness)." *Arizonans for Official English*, 520 U.S. at 68 n.22; *cf. Lujan v. Defenders of Wildlife*, 504 U.S. 555, 560 (1992) (explaining that Article III standing requires the plaintiff to identify "a concrete and imminent invasion of a legally protected

---

[3] The so-called "objections" filed by plaintiffs do not change this result. While the Court has the authority ultimately to enjoin some or all of the 2017 plans, it may only do so in the context of an actual live case or controversy between the parties, which does not exist absent a new lawsuit. Of course, a new lawsuit would permit the parties to engage in discovery and develop a factual record that the Court is preventing through the irregular process it has adopted in this case.

Moreover, plaintiffs have not cited any authority for the proposition that filing "objections" to a new redistricting plan may substitute for a live case or controversy created by a new lawsuit. Of course, had the Court (improperly) taken it upon itself to draw districts in the first instance, such authority would have been exercised under the case or controversy that previously existed between the parties. However, now that the legislature has adopted new plans to replace the 2011 plans, the case filed by plaintiffs over those plans is moot. *See Stephenson v. Bartlett*, 358 N.C. 219, 595 S.E.2d 112 (2004) ("*Stephenson III*").

interest that is neither conjectural nor hypothetical"); *Ashwander v. Tennessee Valley Authority*, 297 U.S. 288, 347 (1936) (Brandeis, J., concurring) ("The Court will not pass upon the validity of a statute upon complaint of one who fails to show that he is injured by its operation."). Because the claims asserted by all plaintiffs are directed at legislation that has now been repealed and replaced, plaintiffs cannot demonstrate that they are likely to be harmed by the challenged redistricting plans. Plaintiffs' inability to identify any threat of injury deprives them of a concrete stake in the outcome of this case, rendering the case moot and divesting this Court of subject matter jurisdiction.

2. It is an abuse of discretion for the special master to propose a plan before a final ruling on the constitutionality of the Subject Districts and without giving the General Assembly a chance to remedy any allegedly unlawful districts.

The special master should recommend to the Court that no districts be drawn by the special master or adopted by the Court until: (1) the Court makes a definitive ruling that explains why any of the specific subject districts are illegal; and (2) gives the State an opportunity to either remedy these new illegalities or seek appellate review.

First, it is inappropriate for the Court to authorize the special master to ask the legislative defendants to comment on, or propose revisions of, districts drawn by the special master when the legislative defendants do not themselves speak for the entire General Assembly. The General Assembly speaks for itself through legislation it enacts on a majority-rule basis. A few members of the legislature, even if they are leaders, are not authorized to state how the entire legislature would vote on, or amend, draft districts proposed by a law professor. The General Assembly spoke with one voice on August 31,

2017 when it adopted the 2017 plans, and those plans are the plans supported by the General Assembly.

In any event, it is inappropriate for the special master, or a Court, to fashion a remedy before a legal violation has been found. It is axiomatic in our legal system that a remedy may not be fashioned until a legal violation has been found. That settled order of operations exists not just because there is no entitlement to a remedy until a wrong has been proven, but because "the scope of the remedy is determined by the nature and extent of the constitutional violation." *Milliken v. Bradley*, 418 U.S. 717, 745 (1974). A remedy is "[t]he means of enforcing a right or preventing or redressing a wrong." *Remedy*, Black's Law Dictionary (10th ed. 2014). A remedy, by its nature, thus cannot be crafted without first identifying the wrong to which it is addressed.

Basic examples illustrate this commonsense principle: judges do not issue provisional sentences before a defendant is found guilty; juries do not make provisional damages awards before adjudicating liability; and courts do not craft provisional remedies before finding a constitutional violation.[4] Those kinds of anticipatory remedial proceedings are alien to our legal system not only because of the presumption of innocence that applies across all legal contexts, but also because of the fundamental unfairness that would result from forcing a defendant to expend resources helping to craft an anticipatory judicial remedy for a wrong that has not even been proven to exist.

[4] To be sure, courts may *impose* temporary remedies during the pendency of litigation, *see, e.g.*, Fed. R. Civ. P. 65; *Winter v. Nat. Res. Def. Council, Inc.*, 555 U.S. 7, 20 (2008), but that is quite different from anticipatorily crafting a remedy that will be imposed only in the event liability is later found.

The principle that a defendant may not be forced to help craft a judicial remedy for a violation that has not yet been found holds particular force in the redistricting context. The Supreme Court has repeatedly admonished that "reapportionment is primarily the duty and responsibility of the State through its legislature or other body, rather than of a federal court." *Chapman v. Meier*, 420 U.S. 1, 27 (1975); *accord Perry v. Perez*, 565 U.S. 388, 392 (2012); *League of United Latin Am. Citizens v. Perry*, 548 U.S. 399, 414 (2006) (plurality opinion); *Miller v. Johnson*, 515 U.S. 900, 915 (1995). Accordingly, courts have no business drawing maps (or empowering special masters to do so) unless and until the State's own maps have been adjudicated invalid, or "an intervening event—most commonly … a census—renders the current plan unusable." *Perry*, 565 U.S. at 392.

Even then, if the State itself is "fully prepared to adopt a [districting] plan" in time for the next regularly scheduled election should its existing plan be invalidated, it is the obligation of the judiciary to give the State the opportunity to do so. *Growe v. Emison*, 507 U.S. 25, 37 (1993). Only "when the governmental body is *unable or unwilling* to fulfill its legislative duties" does it become "the 'unwelcome obligation' of the court to devise and impose a plan" of its own. *Ramos v. Koebig*, 638 F.2d 838, 844 (5th Cir. 1981) (emphasis added) (citation omitted).

Indeed, most of the time judicial intervention occurs when the legislature has failed to enact a remedial plan by a court-imposed deadline. *See, e.g.*, *Personhuballah v. Alcorn*, 155 F. Supp. 3d 552, 555-56 (E.D. Va. 2016) (district court appointed special master after Virginia General Assembly "convened but failed to act"); *Larios v. Cox*, 306

F. Supp. 2d 1212, 1213 (N.D. Ga. 2004) (district court appointed special master after Georgia General Assembly proved "unable to meet [court-imposed] deadline"); *Jackson v. Nassau Cty. Bd. of Supervisors*, 157 F.R.D. 612, 614-15 (E.D.N.Y. 1994) (district court appointed special master after "deadlock and consequential failure" of Nassau County Board of Supervisors to recommend redistricting plan). Beyond that, such intervention has occurred only in the rare instance when there is no time for the legislature to convene and enact a new plan before the next election, *see, e.g.*, *Rodriguez v. Pataki*, 207 F.Supp.2d 123, 124-25 (S.D.N.Y. 2002) (district court appointed special master because "the 'eleventh hour' is upon us, if indeed it has not already passed"); *Beens v. Erdahl*, 336 F.Supp. 715, 719 (D. Minn. 1972) (district court appointed special masters after state legislature adjourned "and was not scheduled to reconvene until after the 1972 general elections").

Moreover, even in the rare instance when a district court is compelled to draw maps itself, the Supreme Court has made abundantly clear that the Court does not possess some freewheeling power to "substitute[] its own concept of 'the collective public good' for the [State] Legislature's determination of which policies serve 'the interests of [its] citizens.'" *Perry*, 565 U.S. at 396. Instead, the Court's task is to draw "maps that comply with the Constitution and the Voting Rights Act, *without* displacing legitimate state policy judgments with the court's own preferences." *Id.* (emphasis added). Accordingly, while a court must "take care not to incorporate into the interim plan any legal defects in the state plan," it may not go beyond that and "modify" aspects of the plan that do not suffer from "any legal flaw." *Id.*

A fortiori, a court may not draw new maps (or empower a special master to do so) before even finding a violation to remedy.[5] Indeed, drawing remedial maps in the absence of an adjudicated or admitted problem with the existing maps is a recipe for precisely the kind of constitutional disaster that *Perry* is supposed to prevent. After all, a court cannot ensure that it is confining itself to its assigned task of remedying "legal defects in the state plan," *id.*, if it does not first identify what the legal defects are. Drawing remedial maps in the absence of an adjudicated or acknowledged wrong to remedy is therefore bound to devolve into an impermissible effort to "displac[e] legitimate state policy judgments with the court's own preferences." *Id.*

The Court did not and could not identify any authority that supports the flawed approach the special master is now working under. Instead, the Court cited *Reynolds v. Sims*, 377 U.S. 533, 585-87 (1964), which it described in a parenthetical as "affirming remedial districting map drawn by a district court after district court found state legislature's first proposed remedial map failed to remedy constitutional violation." D.E. 206 at 4. That is a plainly inaccurate description of *Reynolds*, which actually *forecloses* the district court's one-chance-only rule.

In *Reynolds*, the district court announced in April 1962 that the state's districting plan—which had not been adjusted since 1901—was invalid. *Id*. at 545. By July 1962,

[5] *Perry* involved an unusual circumstance in which the district court was forced to draw interim maps in the absence of an adjudicated legal violation because the intervening census concededly had "render[ed] the current plan unusable," but the State's newly enacted plan had not yet gained preclearance under Section 5 of the Voting Rights Act from the separate district court that was conducting the preclearance proceedings. *Id.* at 342. Obviously, no comparable circumstances exist here, as the district court itself has the power to determine the validity of the 2017 plans anytime it chooses to do so.

the legislature still had not enacted *any* remedial plan for the upcoming November 1962 election; instead, it had enacted only two alternative reapportionment plans that would "take effect for the *1966* elections." *Id.* at 543 (emphasis added). The district court was thus faced with the unwelcome task of deciding what districts should govern the 1962 election. The court concluded that it could not use either of the plans drawn for the 1966 elections because both contained fatal defects. *Id.* at 546-51. So the court combined "the best parts" of the two "as a temporary and provisional measure" for the 1962 election only—a solution that the Supreme Court approved, noting that the district court had "properly refrained from acting … until the Alabama Legislature had been given an opportunity to remedy the admitted discrepancies" itself. *Id.* at 586-87. Thus, as to the 1962 election, *Reynolds* stands only for the proposition (undisputed here) that a district court may impose temporary districts when a state legislature is given a reasonable opportunity to redistrict *but fails to timely act*.

More important here is *Reynolds*' discussion of the 1966 election, which plainly forecloses the existence of any one-chance-only rule. If there really was such a rule, then the state legislature had already wasted its one chance by enacting the two alternative plans that the district court and the Supreme Court held "constitutionally invalid." *Id.* at 568-69. But instead of holding that the district court was now free to impose its own plan for the 1966 election, the Supreme Court made clear that the state had a sovereign right to try again, and that the district court could intervene only if the "Legislature fail to enact a constitutionally valid, permanent apportionment scheme." *Id.* at 587.

Reynolds thus serves only to reinforce the rule that district courts may impose court-drawn maps only in the truly rare circumstance when, after a state's own plan has been adjudicated or admitted legally deficient, the State is unwilling or unable to produce a remedial map—*i.e.*, only when "a last-minute federal-court rescue" is the only option. *Growe*, 507 U.S. at 37. Indeed, legislative defendants are aware of no other redistricting case in which a district court has taken upon itself, over the objection of the State, the "unwelcome obligation" of imposing court-drawn maps, *Connor v. Finch*, 431 U.S. 407, 415 (1977), when the legislature concededly stands ready and willing to do so itself. The Court's outright refusal to give the legislature a chance to remedy any perceived deficiencies in the 2017 plan itself is therefore entirely unprecedented—presumably because it is impossible to reconcile with the Supreme Court's repeated admonishments that "reapportionment is primarily the duty and responsibility of the State." *Chapman*, 420 U.S. at 27.

The Court essentially asked the special master for an advisory opinion prior to making any findings on liability. As legislative defendants have argued previously, this is at best an improper delegation of authority to the special master under Rule 53, Fed. R. Civ. P. Regardless, the special master should assist the Court by explaining why none of the Subject Districts violate the federal constitution. In the alternative, the special master should request the Court to first make a final judgment concerning the 2017 plan and then give defendants an opportunity to cure these new defects or seek appropriate appellate review.

3. The Court's direction to the special master to modify House Districts 36, 37, 40, 41, and 105 is based upon an incorrect interpretation of North Carolina's State Constitution and constitutes a new claim not previously alleged over which the Court and the special master lack jurisdiction.

The special master should advise the Court that no changes should be made in House Districts 36, 37, 40, and 41 in Wake County and House District 105 in Mecklenburg County. *See* D.E. 204, Legislative Defendants' Opposition to Appointment of Nathaniel Persily as Special Master, at 6. The Court has directed the special master to revise these districts based upon a new claim, not previously raised in any pleadings, that these districts violate N.C. Const. art. IV §§ 3(4) and 5(4). Neither the Court nor the special master have jurisdiction to consider these claims. *Pennhurst State Sch. and Hosp. v. Holderman*, 465 U.S. 89, 117 (1984); *Ala. Legislative Black Caucus v. Ala.*, No. 12-CV-691 (July 27, 2015) (Doc. 265) (reaffirming holding that court lacked subject matter jurisdiction to decide whether a state complied with its own state constitution in creating a redistricting plan). Moreover, this jurisdictional question having been raised, it is fundamental error for the Court to conduct merits proceedings, such as the special master's district drawing, as to this state-law issue without first deciding subject matter jurisdiction. *Sinochem Int'l Co. v. Malay Int'l Shipping Corp.*, 549 U.S. 422, 430-31 (2007) ("[A] federal court has leeway 'to choose among threshold grounds for denying audience to a case on the merits'" but "[d]ismissal short of reaching the merits means that the court will not 'proceed at all' to an adjudication of the cause").

Besides lacking−and needing to first rule on− jurisdiction to consider this state law claim, the Court's interpretation of these constitutional processes is erroneous. Both of

these sections of the North Carolina Constitution state that legislative districts "shall remain unaltered until the return of another decennial census . . . " N.C. Const. art. II §§ 3(3) and 5(1). Read literally, this provision would bar the State from drawing any districts even those declared illegal by a federal court. But of course state constitutional law obligates the Supreme Court of North Carolina to harmonize the State Constitution with all federal requirements. *Stephenson v. Bartlett*, 355 N.C. 354, 368-70, 562 S.E.2d 377, 388-89 (2002) ("*Stephenson I*"). The General Assembly has also exercised broad discretion to revise district plans found illegal by federal courts and the federal courts have acknowledged this broad discretion. *Gingles v. Edmiston*, 590 F.Supp. 345, 377-84 (E.D.N.C. 1984), *aff'd in part and rev'd in part sub nom., Thornburg v. Gingles*, 478 U.S. 30 (1986).

Neither the plaintiffs nor the Court cite any precedent to support their novel construction of the North Carolina Constitution that would allow the General Assembly to change illegal districts and districts that adjoin illegal districts, but not allow the General Assembly to modify districts that do not adjoin illegal districts. It is obvious from a review of the 2017 plans that the General Assembly's location and construction of all of the 2017 districts in Wake and Mecklenburg Counties was the result of the way the General Assembly constructed the districts found to be illegal. For example, to comply with the equal population requirements of the North Carolina Constitution, "non-adjoining" districts had to be based in part on divided precincts because precincts were divided in both the illegal districts and the districts that adjoined illegal districts. Further, the shapes and locations of the non-adjoining districts were directly caused by the

location of the illegal districts because of the General Assembly's then-understanding that majority-black districts had to be created before any other districts in both Wake and Mecklenburg Counties. *Stephenson I*, 355 N.C. at 383, 562 S.E.2d at 397. This created a domino effect on all districts within Wake and Mecklenburg Counties of the placement and location of the majority-black districts that have now been declared unconstitutional.

Finally, the Court's erroneous construction of the North Carolina Constitution violates several principles of State law regarding the proper interpretation of the State Constitution. The North Carolina Supreme Court has often said that "[e]very presumption favors the validity of a statute. It will not be declared invalid unless its unconstitutionality be determined beyond reasonable doubt." *Baker v. Martin*, 330 N.C. 331, 334, 410 S.E.2d 887, 889 (1991) (*quoting Gardner v. Reidsville*, 269 N.C. 581, 595, 153 S.E.2d 139, 150 (1967)). This is so because the acts of the legislature are effectively the acts of the people. *State ex rel. Martin*, 325 N.C. 438, 448-49, 385 S.E.2d 473, 478 (1989). *See also Pope v. Easley*, 354 N.C. 544, 546, 556 S.E.2d 265, 267 (2001) (The legislative power rests "with the people and is exercised through the General Assembly, which functions as the arm of the electorate).

An act of the people's elected representatives is thus an act of the people and is presumed valid *unless it conflicts with the Constitution.*") (citation omitted) (emphasis added)). "[I]f there is any doubt as to the Legislature's power to act in any given case, the doubt should be resolved in favor of the Legislature's action." *Baker*, 330 N.C. at 338, 410 S.E.2d at 891 (citations omitted). The 2017 legislative districts must be presumed as satisfying North Carolina law unless it can be shown beyond a reasonable

doubt that the subject districts exceed an express limitation of legislative power contained in the Constitution. Indeed, it is well established that "a court will not adjudge an act of the Legislature invalid, unless its violation of the Constitution is . . . *clear, complete, and unmistakable*". *Kornegay v. City of Goldsboro*, 180 N.C. 441, 445, 105 S.E. 187, 189 (1920) (citations omitted) (emphasis added). "And, as between two permissible interpretations, that should always be adopted which will uphold the law." *Id.* (citations omitted). This is because the "propriety, wisdom, and expediency of legislation is exclusively a legislative question" and there is no ground for judicial interference "unless the act . . . is *unmistakably* in excess of legislative power." *Id.* (citations omitted) (emphasis added). Under these mandates of state law, there is no basis for the special master to recommend to the Court that the subject non-adjoining districts in Wake and Mecklenburg Counties be replaced by the versions proposed by the special master.

4. The special master has improperly engaged in racial sorting to create districts with a mechanical target of black voting age population between 39% and 43.6%.

In its order of November 1, 2017, the Court authorized the special master to "consider data identifying the race of individuals or voters to the extent necessary to ensure that his plan cures the unconstitutional racial gerrymanders and otherwise complies with federal law." D.E. 206 at 9. In so doing, the Court not only preemptively usurped the legislature's power to remedy any deficiencies in the 2017 plan, but empowered the special master to draw remedial maps that will not abide by the Supreme Court's command to "take guidance from the State's recently enacted plan in drafting an interim plan." *Perry*, 565 U.S. at 393. Nowhere is this clearer than in the legislature's

policy decision not to consider race. We are aware of no precedent supporting the proposition that a legislature must consider race when enacting districts to replace illegal racial gerrymanders. The only legitimate reason for a legislature to consider race relates to a state's potential liability under Section 2 of the Voting Rights Act. But, there is no authority that obligates a state to draw new districts either based upon race or designed to avoid future Section 2 claims.

Of course a state can elect to run the risk of using race to draw districts to avoid potential Section 2 liability. But a state may do so only where there is a strong basis in evidence that the minority group is geographically compact and in sufficient numbers to constitute a majority in a single member district, is politically cohesive, and there is evidence of legally significant racially polarized voting. *Harris*, 137 S.Ct. at 1470-1471; *Bartlett v. Strickland*, 556 U.S. 1, 8-11 (2009). There is no authority for using race to draw Section 2 districts with a majority black voting age population absent the presence of legally significant racially polarized voting. This is the heart of the Court's prior decision in this case. Further, in the absence of Section 5, there is no authority for the State or a special master to sort voters based upon race to create districts with less than 50% BVAP. *Georgia v. Ashcroft*, 529 U.S. 461, 491-92 (Kennedy, J., concurring).

Yet racial sorting is exactly what the Court authorized the special master to do when it directed him to "consider data identifying the race of individuals or voters to the extent necessary to ensure that his plan cures the unconstitutional racial gerrymanders . . . ." D.E. 206 at 8, 9. Respectfully, legislative defendants believe this instruction was erroneous and an improper delegation of authority to the special master prior to any final

ruling by the Court explaining why each of the Subject Districts is unconstitutional. The Court did not explain to the parties or the special master how Senate Districts 21 and 28 and House Districts 21 and 57 remain racial gerrymanders or fail to cure federal constitutional violations. Instead, the Court expressed concerns – without explaining them – that those districts "preserve the core shape of the unconstitutional district, divide counties and municipalities along racial lines, and are less compact than their benchmark version." No explanation or evidence was cited by the Court to support these "concerns," as they relate to any of those four districts.

Nor did the Court explain how the General Assembly's use of incumbency and political data in drawing its proposed remedial districts "embedded, incorporated and perpetuated the impermissible use of race." D.E. 206 at 2. There is no precedent for this holding. It cannot be reconciled to the General Assembly's use of incumbency and political data to create the 1997 version of North Carolina's Twelfth Congressional District. This district retained most of the population centers found in the illegal 1992 Twelfth Congressional District and was intentionally designed to elect a Democratic candidate and protect a Democratic incumbent. Yet the 1997 Twelfth Congressional District was affirmed by the Supreme Court even though – unlike the 2017 legislative districts – it did not follow traditional districting principles other than political affiliation. *Easley v. Cromartie*, 532 U.S. 234 (2000); *Hunt v. Cromartie*, 526 U.S. 541, 551 ("Our prior decisions have made clear that a jurisdiction may engage in constitutional political gerrymandering, even if it so happens that the most loyal Democrats happen to be black Democrats and even if the state was conscious of that fact.") It is difficult if not

impossible to reconcile this Court's ruling that the General Assembly's consideration of incumbency "perpetuated the impermissible use of race" given the holding in *Cromartie* affirming a district that was based solely on political criteria.

As disadvantaged as the special master is by the Court's failure to explain how any specific Subject District fails to cure the federal constitutional remedies, the special master candidly stated that his proposed districts are "attempts to remedy the *suspected* constitutional infirmity by removing any residuum of racial predominance that may have been expressed in the 2017 configuration of that district." D.E. 213 at p. 5 (emphasis added). The special master exacerbated the Court's lack of guidance to the parties by giving only a "summary explanation of the principles that guided" the creation of his proposed districts. D.E. 213 at 1. The special master conceded that "greater detail as to the plan's compliance with applicable law" and a "more complete explanation of the rationale" for his plans would only be provided after the parties commented on the plans without that information. In this sense, the special master is simply perpetuating the Court's legal error in not disclosing the evidence relied upon by the Court and how that evidence applied to the Subject Districts before forcing the legislative defendants to comment on the special master's premature draft plans.

In any event, leaving aside the question of what constitutes an acceptable or unacceptable "racial residuum" – an issue that has not yet been explained by the Court – it is clear that one of the steps taken by the special master was to sort voters by race – to decrease the BVAP in his proposed districts to a mechanically targeted range between 39% and 43%.

The legislature clearly did not consider a target range for the "right" percentage of BVAP to include in each district. Instead, the General Assembly adopted a criterion that race should not be considered in constructing the 2017 districts. And, unlike the 2011 redistricting process (where the legislature required VRA districts to have at least 50% BVAP based on its understanding of the extent of legally sufficient racially polarized voting) the percentage BVAP in each of the 2017 Subject Districts was the natural result of non-racial criteria used by the General Assembly to draw them. *Ala. Legislative Black Caucus v. Ala.*, 135 S.Ct. 1257, 1270 (2015) (plaintiffs must prove that the legislature subordinated traditional districting principles including respect for political subdivisions, incumbency, and political affiliation to race); *Bush v. Vera*, 517 U.S. 952, 967 (1996) (where traditional redistricting principles are followed they cannot be said to have been "subordinated to race.")

In contrast to the legislature's decision that race should not be considered, the special master apparently has attempted to remove the "residuum" of "racial predominance" by reducing the BVAP in the Subject Districts to a range of 39% to 43%. This was expressly authorized by the Court, which allowed the special master to engage in racial sorting so long as the percentage BVAP hits a target that might be more acceptable to the Court.

There is no precedent for authorizing racial sorting as a remedy for "correcting" allegedly racially gerrymandered districts. Nor is there any precedent to support a finding that the BVAP in the enacted districts is "too much" of a "residuum" but that the BVAP in the special master's proposed districts is "just right." It defies precedent to

express a "concern" about racial predominance where race was not used to draw the districts and the districts were instead obviously based upon whole counties, whole precincts, municipal lines, and incumbency protection. The only rational way to understand the Court's "concern" is that the special master has been directed to sort voters because of their race to create districts with lower BVAP and which allegedly bear less of a resemblance to the challenged districts. That is certainly how it appears the special master has interpreted the concern, and in doing so he, like the Court, has not articulated any standard other than referencing a nebulous "residuum." Such standards, which amount to no standards at all, will lead to the federal judiciary judging racial "beauty contests" much like the Supreme Court has warned against in assessing the geographic appearance of districts. *Bush*, 517 U.S. at 977.

CONCLUSION

The process under which the special master is proceeding is irregular and inappropriate. It defies precedent, ignores state sovereignty, and imposes race-based redistricting on the State against its will. Unless and until the Court issues a final ruling on the constitutionality of the Subject Districts, the special master should propose in his report to the Court the districts as drawn in 2017 by the North Carolina General Assembly.

This 17th day of November, 2017.

IN THE UNITED STATES DISTRICT COURT
FOR THE MIDDLE DISTRICT OF NORTH CAROLINA
NO. 1:15-CV-00399

SANDRA LITTLE COVINGTON, *et al.*, Plaintiffs, v. STATE OF NORTH CAROLINA, *et al.* Defendants.	**LEGISLATIVE DEFENDANTS' RESPONSE TO PLAINTIFFS' PROPOSED MODIFICATIONS TO SPECIAL MASTER'S DRAFT PLAN**

INTRODUCTION

Plaintiffs' requested modifications to the special master's draft plans demonstrate why the legislature's 2017 plans should be adopted by the special master and the Court. The special master should submit to the Court the enacted 2017 plans and, at a minimum, reject plaintiffs' proposed political modifications to his plans.

The modifications that plaintiffs' request highlight how the Court has substituted its policy choices for those of the legislature. The legislature chose not to use race in drawing the 2017 plans; the Court has placed the special master in the position of making the predominant criterion in his map the drawing of districts to a particular racial quota. In addition, the legislature adopted a policy preference of using election data to ensure that incumbents of both parties were drawn into districts they could potentially win. The Court instructed the special master not to use election data (D.E. 206 at 7) and limited the non-pairing of incumbents to a "distinctly subordinate consideration" to other criteria (D.E. 206 at 7).

In following the Court's criteria, the special master's draft plan apparently causes political problems for numerous Democratic incumbents. Plaintiffs now seek political relief for those political problems. As legislative defendants have explained previously, however, all line-drawing in redistricting has political consequences, even when the mapdrawer purportedly uses only "nonpartisan" criteria. That is why the Constitution commits this task to the political branches and the Supreme Court has repeatedly affirmed that it must be performed by those who are politically accountable, not unelected judges or special masters. In adopting its incumbency protection criteria, the legislature established a policy designed to avoid the very problem plaintiffs' legislative allies are now faced with. If the special master is going to follow the State's policy preferences, then he should recommend the enacted 2017 plans to the Court. At a minimum, the special master should reject the political modifications requested by plaintiffs.

1. The State's policy preferences have been displaced.

The special master's draft plans, and the plaintiffs' response to them, offer a stark picture of how many of the State's redistricting policies have been negated by the Court in favor of its preferences. The legislature adopted a criterion expressly declining to consider race in the drawing of districts, but the Court has allowed the special master to consider race anyway.[1] As a result of the legislature's race-neutral approach, the black

[1] The legislature's decision not to draw race-based districts required it to re-group the counties under the county grouping requirements of *Stephenson v. Bartlett*, 355 N.C. 354, 562 S.E.2d 377 (2002) and *Dickson v. Rucho*, 368 N.C. 481, 781 S.E.2d 404 (2015). The

voting age population ("BVAP") of House Districts 21 and 57 and Senate Districts 21 and 28 were randomly distributed, from a low of 42.34% to a high of 60.75%. Unlike the legislature's plans, these districts in the special master's plan are in a narrow range of 39% to 43% BVAP. In order to draw districts within this range, the special master often had to sacrifice other redistricting policies followed by the State. For instance, the special master split numerous precincts in House District 21, gave less consideration to the Greensboro municipal lines in House District 57 and Senate District 28, moved House District 61 to the center of Greensboro (thereby creating less compact districts in Greensboro),[2] and gave less consideration to the Fayetteville municipal lines in Senate District 21.[3]

More importantly, in service of his predominant goal of eliminating any alleged "residuum" of race from the legislature's plans,[4] which resulted in adherence to an apparent target BVAP between 39% and 43%, the special master's version of these

---

Court instructed the special master to use the county groupings adopted by the legislature. (D.E. 206 at 6)

[2] In moving House District 61 from suburban Greensboro to central Greensboro, the special master negated the legislature's policy choice to create a suburban district that followed city lines. By doing so, the special master was also apparently able to achieve a racial target of 39% to 43% in the three districts he drew in the center of Greensboro, most dramatically in House District 61, in which the special master ramped up the BVAP from 11.47% in the 2017 plan to 41.64% in his draft plan.

[3] In Cumberland County, the special master also made a different policy choice than the legislature related to Senate Districts 19 and 21. For unknown reasons, the special master removed a precinct containing most of Fort Bragg that the legislature had placed in Senate District 19 and placed it into Senate District 21 instead.

[4] To the extent the special master is referring to an alleged "residuum" of race in the 2017 plans from the 2011 version of the districts, it is unclear why the 2011 plans have any relevance to the special master's work. Absent a Section 5 preclearance requirement, the baseline plans for analysis are the 2017 plans enacted by the legislature. The 2017 plans stand or fall on their own as to any alleged racial gerrymandering.

districts shifted some of the core of the districts to other locations in the county. The effect of this in Guilford was to double-bunk Representative Quick and Representative Hardister in House District 59; Representative Harrison and Representative Blust in House District 61; and Senator Wade and Senator Robinson in Senate District 27. In Wake County, the special master's effort to comply with the Court's ruling on a state constitutional issue caused the double-bunking of Representative Ball and Representative Martin in House District 49.

Under the 2017 plans, no double-bunking occurs that was not required by following state county-grouping constitutional requirements. Moreover, incumbents of both parties were drawn into districts in which the 2016 incumbents had a reasonable chance of being elected (based on prior election results). Under the Supreme Court's most recent pronouncements on these issues, the legislature's criteria should have been followed. The Supreme Court has made abundantly clear that the Court does not possess some freewheeling power to "substitute[] its own concept of 'the collective public good' for the [State] Legislature's determination of which policies serve 'the interests of [its] citizens.'" *Perry v. Perez*, 565 U.S. 388, 396 (2012). Instead, the Court's task is to draw "maps that comply with the Constitution and the Voting Rights Act, *without* displacing legitimate state policy judgments with the court's own preferences." *Id.* (emphasis added). Accordingly, while a court must "take care not to incorporate into the interim plan any legal defects in the state plan," it may not go beyond that and "modify" aspects of the plan that do not suffer from "any legal flaw." *Id.* To date, neither the Court nor the special master have explained any specific "legal flaw" in the State adopting

protection of incumbents as a redistricting criterion, or any other "legal flaw" at all for that matter. The cases cited by the Court recognize that fact. (D.E. 206 at 8 (citing *Wyche v. Madison Par. Police Jury*, 769 F.2d 265, 268 (5th Cir. 1985) (noting that "the protection of incumbents" is a factor that is "appropriate in the legislative development of an apportionment plan"))

2. The special master should reject plaintiffs' requested political relief.

The Court and the special master having displaced the legislature's chosen policy preferences, it is not surprising that the draft plans would pair incumbents and have other political ramifications. The Supreme Court has repeatedly noted that it would be "mindless" to think that districting can ever be a neutral process. As explained by the Court:

> Politics and political consideration are inseparable from districting and apportionment. The political profile of a State, its party registration, and voting records are available precinct by precinct, ward by ward. These subdivisions may not be identical with census tracts but, when overlaid on a census map, it requires no special genius to recognize the political consequences of drawing a district line along one street rather than another. It is not only obvious, but absolutely unavoidable, that the location and shape of districts may determine the political complexion of the area. District lines are rarely neutral phenomena. They can well determine what district will be predominantly Democratic, predominantly Republican, or make a close race likely. Redistricting may put incumbents against one another or make very difficult the election of the most experienced legislator. The reality is that districting inevitably has and is intended to have substantial political consequences.
>
> It may be suggested that those who redistrict and reapportion should work with census, not political, data and achieve population equity without regard for political impact. But the *politically mindless* approach may produce, whether intended or not, the most grossly gerrymandered results; and, in any case, it is most unlikely that the political impact of such a plan would remain undiscovered by the time it was proposed or adopted, in which event the results would be both known and, if not changed, intended.

Davis v. Bandemer, 478 U.S. 109, 128-29 (1986) (quoting *Gaffney v. Cummings*, 412 U.S. 735, 752-53 (1973)) (emphasis added).

The self-evident fact that there is no such thing as a politically neutral district line has been repeatedly recognized by the Supreme Court and its Justices. *Bandemer*, 478 U.S. at 129 n.10 ('"The key concept to grasp is that there are no neutral lines for legislative districts . . . every line drawn aligns partisans and interest blocs in a particular way different from putting the line in some other place.'") (citation omitted); *Vieth v. Jubelirer*, 541 U.S. 267, 302-09 (2004) (criteria such as contiguity and compactness are not politically neutral) (Kennedy, J., concurring in judgment) (citations omitted); *Id.* at 343 ("the choice to draw a district line one way, not another, always carries some consequence for politics, save in a mythical state with voters of every political identity distributed in an absolutely growing uniformity) (Souter, Ginsburg, J. J., dissenting); *Id.* at 359 (in a system of single-member districts the use of traditional districting principles is rarely, if ever, politically neutral) (Breyer, J., dissenting).

Plaintiffs now ask the special master to rescue some incumbents but not others. All of the incumbents for whom plaintiffs seek relief are Democrats. Plaintiffs do not seek relief for any affected Republican incumbents.[5] Plaintiffs' political motivations have already been recognized and rejected by the Court. (D.E. 206 at 2 ("The Court is concerned that, among other things, some of the districts proposed by the Plaintiffs may

[5] While Democratic Representative Quick is double-bunked with Republican Representative Hardister, plaintiffs seek to move Representative Quick out of a district that is more likely to elect a Republican candidate and into an adjoining district that is more likely to elect a Democratic candidate.

be the result of impermissible political considerations.")) These requests should be rejected.

First, the Court instructed the special master that non-pairing of incumbents should be a "distinctly subordinate consideration" in his plans. Plaintiffs do not offer any non-political justification for their request to un-pair the Democratic incumbents for whom they seek relief. Un-pairing these incumbents cannot be justified as a state redistricting policy because the state's policy was to draw separate districts in which the incumbents had a reasonable opportunity to be elected. Justifying plaintiffs' modifications by referencing the State's criteria would not only violate that criteria, it would amount to cherry-picking incumbents who benefit from the criteria in favor of one political party.

Next, plaintiffs' proposed modifications would, by their own admission, violate other traditional redistricting criteria. For instance, placing Representative Quick into an adjoining House district would require the special master to either split a new precinct or make his existing district less compact. (D.E. 216 at 2-3) In Wake County, plaintiffs propose re-splitting a precinct that had not been split by the special master. (D.E. 216 at 3-4) In requesting that Democratic Representatives Ball and Martin be un-paired, plaintiffs reduce several of the compactness scores in multiple districts.[6] (D.E. 216 at 4-

[6] Moreover, the population ripples created by plaintiffs' proposed changes in Wake County illustrate why eliminating the racial gerrymandering found in the 2011 districts necessarily requires the legislature to have the ability to change all of the districts within any given county grouping, including a single-county grouping such as Wake County. As demonstrated by plaintiffs' requested change to House District 40, the population ripple in changing a district affects more than just "adjoining" districts. Plaintiffs' proposed change to House District 40 overpopulates adjoining House District 49. Removing population from House District 49 requires changing a district that did not

5) Given the lack of any non-political reason justifying plaintiffs' proposed modifications, the special master should certainly not violate neutral criteria to further a political outcome. In protecting incumbents, the special master should "take guidance from the State's recently enacted plan in drafting an interim plan," *Perry*, 565 U.S. at 393, and submit the State's 2017 plans.

CONCLUSION

Plaintiffs' requested modifications and the special master's proposed plans demonstrate why the legislature's 2017 plans should be adopted by the special master and the Court. If the special master is going to follow the state's policy preferences, then he should recommend the enacted 2017 plans to the Court. At a minimum, the special master should reject plaintiffs' proposed political modifications.

---

originally adjoin House District 40. Plaintiffs' claim that the "obvious" choice to receive the extra population is House District 34 (D.E. 216 at 4) but it would be just as legitimate for a legislature to choose a different non-adjoining district to receive the population caused by the change to House District 40. In this respect, the Court's mandate to the special master not to change districts that did not adjoin unconstitutional districts is a substitution of the Courts' policy preference for the legislature's preference, under the guise of state law.

This 21st day of November, 2017.

IN THE UNITED STATES DISTRICT COURT
FOR THE MIDDLE DISTRICT OF NORTH CAROLINA

SANDRA LITTLE COVINGTON, et al.,	)	
	)	
Plaintiffs,	)	
	)	
v.	)	1:15-CV-399
	)	
THE STATE OF NORTH CAROLINA, et al.,	)	
	)	
Defendants.	)	

ORDER

On August 11, 2016, this Court unanimously concluded that the Defendants unjustifiably relied on race in drawing lines creating twenty-eight majority-minority districts in the 2011 state legislative districting plans, in violation of the Plaintiffs' rights under the Equal Protection Clause of the Fourteenth Amendment. *Covington v. North Carolina*, 316 F.R.D. 117, 176 (M.D.N.C. 2016), *aff'd*, 137 S. Ct. 2211 (2017) (mem.). To remedy the constitutional violation, the North Carolina General Assembly enacted proposed remedial plans on August 31, 2017. On September 15, 2017, the Plaintiffs filed objections to three Senate districts and nine House districts created by the proposed remedial plans. Thereafter, the Legislative Defendants filed a response to Plaintiffs' objections. This Court held a hearing concerning the objections on October 12, 2017.

After careful review of the parties' written submissions, arguments, and evidence, the Court has serious concerns that 2017 Enacted Senate Districts 21 and 28 and 2017 Enacted House Districts 21 and 57 fail to remedy the identified constitutional violation.

See id. at 146-47 (Senate District 21); *id.* at 147-48 (Senate District 28); *id.* at 155-56 (House District 21); *id.* at 163-64 (House District 57). Among other concerns, some or all of the proposed remedial districts preserve the core shape of the unconstitutional version of the district, divide counties and municipalities along racial lines, and are less compact than their benchmark version. In some cases, the General Assembly's use of incumbency and political data in drawing its proposed remedial districts embedded, incorporated, and perpetuated the impermissible use of race that rendered unconstitutional the 2011 districts. The 2017 Enacted Districts do not appear to cure the constitutional violations found as to 2011 Enacted House Districts 21 and 57 and Senate Districts 21 and 28. The Court is concerned that, among other things, some of the districts proposed by the Plaintiffs may be the result of impermissible political considerations. *See infra* ¶ 2(h).

The Court further has serious concerns that the 2017 redrawing of 2011 Enacted House Districts 36, 37, 40, and 41 in Wake County and House District 105 in Mecklenburg County exceeded the authorization to redistrict provided in the Court's previous orders. None of these districts as enacted in 2011 was found to be an unconstitutional racial gerrymander, nor do any of these districts adjoin such a district. The Legislative Defendants have not provided any evidence that it was necessary to redraw these districts in order to cure the constitutional violations found by the Court as to 2011 House Districts 33 and 38 in Wake County or House Districts 99, 102, or 107 in Mecklenburg County. Unless required by court order, the General Assembly was prohibited by the North Carolina Constitution from redrawing these districts. N.C. Const.

art. II §§ 3(4), 5(4). If these 2017 Enacted Districts cannot be used, it also becomes impossible to use the other 2017 Enacted Districts in Mecklenburg and Wake Counties, thus necessitating the redrawing of the 2011 unconstitutional districts – House Districts 33, 38, 99, 102, and 107 – and only such adjoining districts as are necessary to remedy the violations found as to those districts. *See Covington*, 316 F.R.D. at 159-61 (House Districts 33 and 38); *id.* at 164-66 (House Districts 99, 102, and 107); *see also Cleveland Cnty. Ass'n for Gov't by the People v. Cleveland Cnty. Bd. of Comm'rs*, 142 F.3d 468, 477 (D.C. Cir. 1998) (per curiam) ("[I]f a violation of federal law *necessitates* a remedy barred by state law, the state law must give way; if no such violation exists, principles of federalism dictate that state law governs." (emphasis added)).

Constitutionally adequate districts must be in place in time for the 2018 election, and the Court finds it appropriate to appoint a Special Master to assist the Court in drawing such districts, should the Court ultimately determine they are necessary. *See* Doc. 202 at 2. After reviewing the Special Master's report, and with the benefit of his analysis, this Court will issue an order finally deciding whether the Plaintiffs' objections will be sustained and determining the districting plan to be used going forward. *See Personhuballah v. Alcorn*, 155 F. Supp. 3d 552, 562-65 (E.D. Va. 2016) (relying on special master report and remedial districting plan to assess proposed legislative remedial plan); Order Appointing Special Master, *Navajo Nation v. Ariz. Indep. Redistricting*, Nos. CV 02-0799, 02-0807 (D. Ariz. May 17, 2002) (appointing special master "to evaluate evidence regarding proposed redistricting plans," including remedial plan adopted by state redistricting body, and to "assist the court in developing an appropriate plan").

In view of the fast-approaching filing period for the 2018 election cycle and the specialized expertise necessary to draw district maps, the Court has previously given notice of its intent to appoint Professor Nathaniel Persily as Special Master pursuant to Federal Rule of Civil Procedure 53(a)(1)(C). *See* Doc. 202. The Court's selected Special Master has filed the affidavit required by Federal Rule of Civil Procedure 53(b)(3)(A). Doc. 203.

The parties have had an opportunity to object to the Court's selection of a Special Master. The Legislative Defendants filed objections, Doc. 204, and the Plaintiffs have responded. Doc. 205. The Court has considered those objections and overrules them. The State is not entitled to multiple opportunities to remedy its unconstitutional districts. *See Reynolds v. Sims*, 377 U.S. 533, 585-87 (1964) (affirming remedial districting map drawn by a district court after district court found state legislature's first proposed remedial map failed to remedy constitutional violation). Additionally, the fast-approaching candidate filing deadline necessitates an expedited schedule. In light of the need for an expedited schedule, the Court's two notices of its intent to appoint a special master, the first of which was issued approximately three weeks ago, provided the parties with more than adequate notice and opportunity to be heard. It is comparable to the timeline followed in similar cases. *See* Order, *Personhuballah v. Alcorn*, No. 3:13cv678, Doc. No. 241 (E.D. Va. Sept 25, 2015) (appointing special master approximately three weeks after first notifying parties of its intent to appoint special master); *see also* Order, *Personhuballah v. Alcorn*, No. 3:13cv678, Doc. No. 207 (E.D. Va. Sept. 3, 2015) (notifying parties of intent to appoint special master). The Legislative Defendants'

specific objections to the identified Special Master are speculative and insubstantial, and they have not made an alternative suggestion despite the Court's invitation to do so.

Pursuant to Federal Rule of Civil Procedure 53, it is hereby **ORDERED** that:

1. Dr. Nathaniel Persily is appointed as a Special Master to submit a report and proposed plans to remedy the unconstitutional racial gerrymander of 2011 Enacted Senate Districts 21 and 28 and House Districts 21, 33, 38, 57, 99, 102, and 107 (hereinafter the "Subject Districts"), as more specifically identified in this Court's opinion in *Covington v. North Carolina*, 316 F.R.D. 117 (M.D.N.C. 2016), *aff'd in relevant part*, 137 S. Ct. 2211 (2017) (mem.). His report is due no later than December 1, 2017.
2. In drawing remedial districts, the Special Master shall:
    a. Redraw district lines for the Subject Districts and any other districts within the applicable 2017 county grouping necessary to cure the unconstitutional racial gerrymanders. As to House District 57, the redrawn lines shall also ensure that the unconstitutional racial gerrymanders in 2011 Enacted House Districts 58 and 60 are cured. As to 2011 Enacted House Districts 33, 38, 99, 102, and 107, no 2011 Enacted House Districts which do not adjoin those districts shall be redrawn unless it is necessary to do so to meet the mandatory requirements set forth in Paragraphs 2(b) through 2(e) of this Order, and if the Special Master concludes that it is necessary to adjust the lines of

a non-adjoining district, the Special Master shall include in his report an explanation as to why such adjustment is necessary.

b. Use the 2010 Federal Decennial Census Data;

c. Draw contiguous districts with a population as close as possible to 79,462 persons for the House Districts and 190,710 persons for the Senate Districts, though a variance up to +/- 5% is permitted and authorized if it would not conflict with the primary obligations to ensure that remedial districts remedy the constitutional violations and otherwise comply with state and federal law, would enhance compliance with state policy as set forth in subsection (f) below, and would not require redrawing lines for an additional district.

d. Adhere to the county groupings used by the General Assembly in the 2017 Enacted Senate and House Plans;

e. Subject to any requirements imposed by the United States Constitution or federal law, comply with North Carolina constitutional requirements including, without limitation, the Whole County Provision as interpreted by the North Carolina Supreme Court.

f. Make reasonable efforts to adhere to the following state policy objectives, so long as adherence to those policy objectives does not conflict with the primary obligations of ensuring that remedial districts remedy the constitutional violations and otherwise comply with state and federal law:

i. Split fewer precincts than the 2011 Enacted Districts;

ii. Draw districts that are more compact than the 2011 Enacted Districts, using as a guide the minimum Reock ("dispersion") and Polsby-Popper ("perimeter") scores identified by Richard Pildes & Richard Neimi, *Expressive Harms, "Bizarre Districts," and Voting Rights: Evaluating Election-District Appearances After Shaw v. Reno*, 92 Mich. L. Rev. 483 (1993); and

iii. Consider municipal boundaries and precinct lines.

g. After redrawing the districts, in view of the policy decision by the General Assembly that efforts to avoid pairing incumbents are in the interest of North Carolina voters, the Special Master may adjust district lines to avoid pairing any incumbents who have not publicly announced their intention not to run in 2018, but only to the extent that such adjustment of district lines does not interfere with remedying the constitutional violations and otherwise complying with federal and state law. Additionally, the Special Master shall treat preventing the pairing of incumbents as "a distinctly subordinate consideration" to the other traditional redistricting policy objectives followed by the State. *Ga. State Conf. of NAACP v. Fayette Cty. Bd. of Comm'rs*, 996 F. Supp. 2d 1353, 1363 (N.D. Ga. 2014) (collecting cases).

h. Except as authorized in Paragraph 2(g), the Special Master shall not consider incumbency or election results in drawing the districts. *See,*

e.g., *Wise v. Lipscomb*, 437 U.S. 535, 541 (1978) (noting that courts lack "political authoritativeness" and must act "in a manner free from any taint of arbitrariness or discrimination" in drawing remedial districts) (quoting *Connor v. Finch*, 431 U.S. 408, 417 (1977)); *Wyche v. Madison Par. Police Jury*, 769 F.2d 265, 268 (5th Cir. 1985) ("Many factors, such as the protection of incumbents, that are appropriate in the legislative development of an apportionment plan have no place in a plan formulated by the courts."); *Wyche v. Madison Par. Police Jury*, 635 F.2d 1151, 1160 (5th Cir. 1981) (noting that "a court is forbidden to take into account the purely political considerations that might be appropriate for legislative bodies"); *Favors v. Cuomo*, Docket No. 11–cv–5632, 2012 WL 928216, at *18 (E.D.N.Y. Mar. 12, 2012), *report and recommendation adopted as modified*, No. 11-cv-5632, 2012 WL 928223, at *6 (E.D.N.Y Mar. 19, 2012),; *Molina v. Cty. of Orange*, No. 13CV3018, 2013 WL 3039589, at *8 (S.D.N.Y. June 3, 2013), *supplemented*, No. 13CV3018, 2013 WL 3039741 (S.D.N.Y. June 13, 2013), *report and recommendation adopted*, No. 13 CIV. 3018 ER, 2013 WL 3009716 (S.D.N.Y. June 14, 2013); *Larios v. Cox*, 306 F. Supp. 2d 1214, 1218 (N.D. Ga. 2004); *Balderas v. Texas*, No. 6:01CV158, 2001 WL 36403750, at *4 (E.D. Tex. Nov. 14, 2001).

i. The Special Master may consider data identifying the race of individuals or voters to the extent necessary to ensure that his plan cures

the unconstitutional racial gerrymanders and otherwise complies with federal law.

3. The Special Master may consider the plans submitted by the Plaintiffs and the 2017 Enacted plans as background. Because any remedy must be narrowly tailored to address the harm, he further should use any 2017 Enacted Districts within a relevant county grouping which do not abut or overlap with a Subject District, except to the extent modification of such district is necessary to comply with and meet the requirements of this Order. *See Personhuballah*, 155 F. Supp. 3d at 563 (discussing Supreme Court precedent and concluding that in remedying a violation, the only districts which should be changed are those that are "require[d]" to be changed). Any such decisions shall be explained in his report. Otherwise, he shall draw his own plans using the criteria set forth herein.

4. The Special Master is authorized to hire research and technical assistants and advisors reasonably necessary to facilitate his work, who shall be reasonably compensated by the State of North Carolina in the same way as the Special Master. He is authorized to buy any specialized software reasonably necessary to facilitate his work.

5. To facilitate the consideration of incumbency authorized by Paragraph 2(g), the parties shall confer and, no later than November 8, 2017, shall file a Joint Submission identifying incumbents covered by Paragraph 2(g) by name, address, and date first elected.

6. Upon request from the Special Master, the parties shall promptly make available to the Special Master electronic copies of trial and hearing transcripts, trial exhibits, motions, briefs, and evidentiary material otherwise submitted to the Court. Such a request shall be communicated by way of an email message to counsel of record for all parties.

7. The parties, including the North Carolina Legislative Analysis Division, shall promptly respond to the best of their ability to any reasonable request by the Special Master for supporting data or information as is reasonably necessary to carry out his assignment. All such requests and responses shall be made by email, with all counsel copied. Upon such a request, the requested party shall respond promptly to the best of its ability. The Special Master may, but is not required to, request briefs on such background matters as he would find helpful. The Special Master is not authorized to take new evidence, absent request to do so and approval from the Court.

8. The Special Master may, but is not required to, convene the parties for a discussion about logistics, software, data, and other housekeeping or technical issues, including whether it would or might save time or other resources to use computers, software, data, or other facilities and materials controlled by the State and to have technical assistance from a support person employed by the State in the use of such materials. He may convene such a discussion upon reasonable notice at a time and place and in a method convenient to him, though if an in-person meeting or hearing is convened it shall occur in North

Carolina. He shall advise the parties of the time and other details by way of an email message to counsel of record for all parties.

9. If the Special Master determines that it would save time and otherwise facilitate prompt completion of his work to use state technical resources and so long as the parties consent to such use under terms which would not give the State advance or ex parte knowledge of the Special Master's work and which would prevent the State from accessing such work or communicating with its support employee about such work, the Court will entertain a request to supplement this Order.

10. If time permits and the Special Master would find it helpful, he may publicly release preliminary maps or plans and convene a hearing, meeting, or informal conference to evaluate whether the preliminary maps meet the criteria set forth herein or raise unanticipated problems. The Special Master shall advise the parties of the time and other details by way of an email message to counsel of record for all parties and shall file notice with the court. A transcript shall be prepared of any such hearing, meeting, or conference, and, if it does not occur in open court, be made available on the Court's docket.

11. The Special Master is prohibited from engaging in any ex parte communication with the parties or their counsel, except as specifically authorized by this Order.

12. The Special Master is prohibited from discussing this matter with anyone else, other than assistants or advisors he retains to complete his work, except as

specifically authorized by this Order. Any assistants or advisors retained by the Special Master may discuss the matter only with the Special Master.

13. The Special Master may communicate ex parte with the Clerk of Court, the Clerk's staff, and the Court about housekeeping, scheduling, and logistical matters. If necessary to clarify or supplement these instructions, the Special Master may communicate ex parte with the Court, provided he promptly advises the parties that the communication has occurred and discloses any material guidance he has received.

14. Pursuant to Rule 53(b)(2)(C), the Special Master shall maintain orderly files consisting of all documents submitted to him by the parties and any written orders, findings, and recommendations. All other materials relating to the Special Master's work should be preserved until relieved of this obligation by the court. The Special Master shall preserve all datasets used in the formulation of redistricting plans, and any drafts considered but not recommended to the court, in their native format.

15. The Special Master's final report shall contain:

    a. At least one recommended redistricting plan for each Subject District;

    b. For each county or county grouping encompassing a Subject District, a color map showing the recommended remedial plan;

    c. For each Subject District, an analysis (i) explaining the proposed remedial plan and the recommendation of that plan over the 2017 Enacted Districts or the Plaintiffs' proposed districts; (ii) covering any

matters required elsewhere in this Order; and (iii) discussing any criteria, issues, or questions which the Special Master believes may arise or which will otherwise aid the Court;

d. A comparison of the Special Master's districts with the related 2011 and 2017 Enacted Districts as to population deviations; compactness; county, municipal, and precinct splits; incumbency pairing; Black Voting Age Population; and any other relevant criteria; and

e. A "stat pack" for the recommended plans.

16. If any party believes the report should contain additional information, it shall meet and confer with other parties and thereafter file an appropriate request no later than November 6, 2017. In lieu of a brief in support, the request shall be accompanied by a Joint Submission including the positions of all parties so that responses will not be needed.

17. The Special Master shall file his report electronically on the Court's CM/ECF system. The Legislative Defendants shall promptly post the Special Master's report and supporting electronic files to its redistricting website.

18. The Court will review the report pursuant to Fed. R . Civ. P. 53(f).

19. If any party or non-party believes that one or more proposed districts set forth in the Special Master's report is legally unacceptable or otherwise should not be adopted, specific objections must be filed within five business days. Any response must be filed within three business days. Briefs are limited to 5000 words. Reply briefs limited to 2500 words may thereafter be filed within two

business days. The Court anticipates scheduling a hearing on the report in early January 2018. Fed. R. Civ. P. 53(f)(1).

20. The Court understands the candidate filing period to be from February 12 to February 28, 2018. Doc. 162-1. If that is or becomes incorrect, the Defendant State Board of Elections shall immediately advise the Court.

21. The Court may modify this order pursuant to Federal Rule of Civil Procedure 53(b)(4). The parties may seek to modify this order for good cause shown, but no such motion shall be filed without meeting and conferring in person with all other counsel. Absent agreement, the time to respond to such a motion is two business days and no reply will be permitted.

Entered by the Court, this the 1st day of November, 2017.

STATE OF NORTH CAROLINA

COUNTY OF WAKE

IN THE GENERAL COURT OF JUSTICE
SUPERIOR COURT DIVISION
21 CVS 015426

NORTH CAROLINA LEAGUE OF CONSERVATION VOTERS, et al.,

Plaintiffs,

vs.

REPRESENTATIVE DESTIN HALL, in his official capacity as Chair of the House Standing Committee on Redistricting, et al.,

Defendants.

AFFIDAVIT OF SEAN P. TRENDE

Now comes affiant Sean P. Trende, having been first duly cautioned and sworn, deposes and states as follows:

1. I am over the age of 18 and am competent to testify regarding the matters discussed below.

2. I currently reside at 1146 Elderberry Loop, Delaware, OH 43015. My e-mail is trende.3@buckeyemail.osu.edu.

3. I have been retained in this matter by the Legislative Defendants, and am being compensated at $400.00 per hour for my work in this case.

4. My *curriculum vitae* is attached to this report as Exhibit 1.

EXPERT CREDENTIALS

5. I am currently enrolled as a doctoral candidate in political science at The Ohio State University. I have completed all of my coursework and have passed comprehensive examinations in both methods and American Politics. My coursework for my Ph.D. and

NCLCV v. Hall
21 CVS 15426
LDTX106

M.A.S. included, among other things, classes on G.I.S. systems, spatial statistics, issues in contemporary redistricting, machine learning, non-parametric hypothesis tests and probability theory. I expect to receive my Ph.D. in May of 2021. My dissertation focuses on applications of spatial statistics to political questions.

6. I joined RealClearPolitics in January of 2009. I assumed a fulltime position with RealClearPolitics in March of 2010. My title is Senior Elections Analyst. RealClearPolitics is a company of around 40 employees, with offices in Washington D.C. It produces one of the most heavily trafficked political websites in the world, which serves as a one-stop shop for political analysis from all sides of the political spectrum and is recognized as a pioneer in the field of poll aggregation. It produces original content, including both data analysis and traditional reporting. It is routinely cited by the most influential voices in politics, including David Brooks of *The New York Times*, Brit Hume of *Fox News*, Michael Barone of *The Almanac of American Politics*, Paul Gigot of *The Wall Street Journal*, and Peter Beinart of *The Atlantic*.

7. My main responsibilities with RealClearPolitics consist of tracking, analyzing, and writing about elections. I collaborate in rating the competitiveness of Presidential, Senate, House, and gubernatorial races. As a part of carrying out these responsibilities, I have studied and written extensively about demographic trends in the country, exit poll data at the state and federal level, public opinion polling, and voter turnout and voting behavior.

8. In particular, understanding the way that districts are drawn and how geography and demographics interact is crucial to predicting United States House of Representatives races, so much of my time is dedicated to that task.

9. I am currently a Visiting Scholar at the American Enterprise Institute, where my publications focus on the demographic and coalitional aspects of American Politics. My first paper focused on the efficiency gap, a metric for measuring the fairness of redistricting plans.

10. I am the author of *The Lost Majority: Why the Future of Government is up For Grabs and Who Will Take It.* In this book, I explore realignment theory. It argues that realignments are a poor concept that should be abandoned. As part of this analysis, I conducted a thorough analysis of demographic and political trends beginning in the 1920s and continuing through the modern times, noting the fluidity and fragility of the coalitions built by the major political parties and their candidates.

11. I co-authored the 2014 *Almanac of American Politics*. The Almanac is considered the foundational text for understanding congressional districts and the representatives of those districts, as well as the dynamics in play behind the elections. PBS's Judy Woodruff described the book as "the oxygen of the political world," while NBC's Chuck Todd noted that "[r]eal political junkies get two *Almanacs*: one for the home and one for the office." My focus was researching the history of and writing descriptions for many of the newly-drawn districts, including tracing the history of how and why they were drawn the way that they were drawn.

12. I have spoken on these subjects before audiences from across the political spectrum, including at the Heritage Foundation, the American Enterprise Institute, the CATO Institute, the Bipartisan Policy Center, and the Brookings Institution. In 2012, I was invited to Brussels to speak about American elections to the European External Action Service, which is the European Union's diplomatic corps. I was selected by the United States Embassy in Sweden to discuss the 2016 elections to a series of audiences there, and was selected by the United

States Embassy in Spain to fulfil a similar mission in 2018. I was invited to present by the United States Embassy in Italy, but was unable to do so because of my teaching schedule.

13. In the winter of 2018, I taught American Politics and the Mass Media at Ohio Wesleyan University. I taught Introduction to American Politics at The Ohio State University for three semesters from Fall of 2018 to Fall of 2019. In the Springs of 2020 and 2021, I taught Political Participation and Voting Behavior at The Ohio State University. This course spent several weeks covering all facets of redistricting: How maps are drawn, debates over what constitutes a fair map, measures of redistricting quality, and similar topics.

14. It is my policy to appear on any major news outlet that invites me, barring scheduling conflicts. I have appeared on both Fox News and MSNBC to discuss electoral and demographic trends. I have been cited in major news publications, including *The New York Times*, *The Washington Post*, *The Los Angeles Times*, *The Wall Street Journal*, and *USA Today*.

15. I sit on the advisory panel for the "States of Change: Demographics and Democracy" project. This project is sponsored by the Hewlett Foundation and involves three premier think tanks: The Brookings Institution, the Bipartisan Policy Center, and the Center for American Progress. The group takes a detailed look at trends among eligible voters and the overall population, both nationally and in key states, to explain the impact of these changes on American politics, and to create population projections, which the Census Bureau abandoned in 1995. In 2018, I authored one of the lead papers for the project: "In the Long Run, We're All Wrong," available at https://bipartisanpolicy.org/wp-content/uploads/2018/04/BPC-Democracy-States-of-Change-Demographics-April-2018.pdf.

16. I previously authored an expert report in *Dickson v. Rucho*, No. 11-CVS-16896 (N.C. Super Ct., Wake County), which involved North Carolina's 2012 General Assembly and

Senate maps. Although I was not called to testify, it is my understanding that my expert report was accepted without objection. I also authored an expert report in *Covington v. North Carolina*, Case No. 1:15-CV-00399 (M.D.N.C.), which involved almost identical challenges in a different forum. Due to what I understand to be a procedural quirk, where my largely identical report from *Dickson* had been inadvertently accepted by the plaintiffs into the record when they incorporated parts of the *Dickson* record into the case, I was not called to testify.

17. I authored two expert reports in *NAACP v. McCrory*, No. 1:13CV658 (M.D.N.C.), which involved challenges to multiple changes to North Carolina's voter laws, including the elimination of a law allowing for the counting of ballots cast in the wrong precinct. I was admitted as an expert witness and testified at trial. My testimony discussed the "effect" prong of the Voting Rights Act claim. I did not examine the issues relating to intent.

18. I authored reports in *NAACP v. Husted*, No. 2:14-cv-404 (S.D. Ohio), and *Ohio Democratic Party v. Husted*, Case 15-cv-01802 (S.D. Ohio), which dealt with challenges to various Ohio voting laws. I was admitted and testified at trial in the latter case (the former case settled). The judge in the latter case ultimately refused to consider one opinion, where I used an internet map-drawing tool to show precinct locations in the state. Though no challenge to the accuracy of the data was raised, the judge believed I should have done more work to check that the data behind the application was accurate.

19. I served as a consulting expert in *Lee v. Virginia Board of Elections*, No. 3:15-cv-357 (E.D. Va. 2016), a voter identification case. Although I would not normally disclose consulting expert work, I was asked by defense counsel to sit in the courtroom during the case and review testimony. I would therefore consider my work *de facto* disclosed.

20. I filed an expert report in *Mecinas v. Hobbs*, No. CV-19-05547-PHX-DJH (D. Ariz. 2020). That case involved a challenge to Arizona's ballot order statute. Although the judge ultimately did not rule on a motion in limine in rendering her decision, I was allowed to testify at the hearing.

21. I authored two expert reports in *Feldman v. Arizona*, No. CV-16-1065-PHX-DLR (D. Ariz.). Plaintiffs in that case challenged an Arizona law prohibiting the collection of voted ballots by third parties that were not family members or caregivers and the practice of most of the state's counties to require voters to vote in their assigned precinct. My reports and testimony were admitted. Part of my trial testimony was struck in that case for reasons unrelated to the merits of the opinion; counsel for the state elicited it while I was on the witness stand and it was struck after Plaintiffs were not able to provide a rebuttal to the new evidence.

22. I authored an expert report in *Smith v. Perrera*, No. 55 of 2019 (Belize). In that case I was appointed as the court's expert by the Supreme Court of Belize. In that case I was asked to identify international standards of democracy as they relate to malapportionment claims, to determine whether Belize's electoral divisions (similar to our congressional districts) conformed with those standards, and to draw alternative maps that would remedy any existing malapportionment.

23. I authored expert reports in *A. Philip Randolph Institute v. Smith*, No. 1:18-cv-00357-TSB (S.D. Ohio), *Whitford v. Nichol*, No. 15-cv-421-bbc (W.D. Wisc.), and *Common Cause v. Rucho*, NO. 1:16-CV-1026-WO-JEP (M.D.N.C.), which were efficiency gap-based redistricting cases filed in Ohio, Wisconsin and North Carolina.

24. I also authored an expert report in the cases of *Ohio Organizing Collaborative, et al v. Ohio Redistricting Commission, et al* (No. 2021-1210); *League of Women Voters of Ohio, et al v. Ohio Redistricting Commission, et al* (No. 2021-1192); *Bria Bennett, et al v. Ohio Redistricting Commission, et al* (No. 2021-1198). These cases are pending in original action before the Supreme Court of Ohio.

25. I currently serve as one of two special masters appointed by the Supreme Court of Virginia to redraw the districts that will elect the commonwealth's representatives to the House of Delegates, state Senate, and U.S. Congress.

SUMMARY OF WORK PERFORMED

26. I certify that the images attached as Exhibit 2 are true and correct copies of images that I created and that I describe below.

27. To create these images, I first downloaded county-level shapefiles from the United States Census Bureau. Using R, a widely utilized statistical programming tool, I joined county-level vote totals for U.S. presidential races in 2012, 2016 and 2020.

28. Attached as Exhibit 2-A are maps I generated with counties colored red if the Republican candidate won that county, and blue if the Democratic candidate won that county.

29. I then centered these results on national popular vote results for the respective years, an accepted mechanism that is used to enable analysts to compare results that occur in differing electoral environments. *See, e.g.*, Bernard Fraga, "Candidates or Districts? Reevaluating the Role of Race in Voter Turnout," 60 *Am. Jrnl. Pol. Sci.* 97, 115 (2016). Because the national popular vote reflected reasonably close Democratic wins in all four years, the effect of doing this computation is marginal.

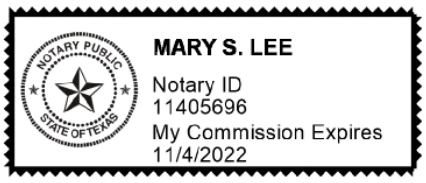
30. Attached as Exhibit 2-B are maps I generated with counties colored red if the Republican candidate performed better in the county than they did nationally, and blue if the Republican candidate performed worse in the county that they did nationally. If the Republican candidate performed better in the county than they did nationally, I refer to that performance as "leaning" Republican.

31. As shown in Table 1 below, in 2012, the Republican presidential candidate won 70 of North Carolina's 100 counties. In 2016, the Republican presidential candidate won 76 counties, and in 2020, the Republican presidential candidate won 75 counties.

32. As shown in Table 1 below, in 2012, the number of counties in North Carolina that leaned[1] Republican in the Presidential Election was 73 out of 100, in 2016 that figure was 77 out of 100, and in 2020 that figure was 80 out of 100.

TABLE 1

Election Year	# of N.C. Counties that voted Republican	# of N.C. Counties that leaned Republican
2012	70/100	73/100
2016	76/100	77/100
2020	75/100	80/100



[1] "Leaned" is as defined in ¶ 30.

10 Conclusion 266

1 Introduction and Qualifications

I have been asked by counsel for the Legislative Defendants to analyze North Carolina's recently enacted redistricting plans for the General Assembly (the "Enacted Plans") and the plans submitted by the North Carolina League of Conservation Voters (the "Duchin Plans") in the context of the partisan gerrymandering claims brought against the Legislative Defendants.[1] To do this, I implement a publicly available and peer-reviewed redistricting simulation algorithm to generate 50,000 simulated district maps in each county grouping in which there are multiple districts in both the North Carolina House of Representatives and the North Carolina Senate. The redistricting algorithm generates a representative sample of districts by following neutral redistricting criteria without regard to racial or partisan data. In this way, the simulated districts establish a comparison set of plans that use purely non-partisan redistricting inputs. I then compare the simulated plans against the Enacted Plans and the Duchin Plans by reference to election results to assess whether the partisan effects of those plans are consistent with what one would expect to see in a redistricting plan composed without reference to any partisan considerations.

In the House, these simulations show that the Enacted Plans consistently score more often within the range of the non-partisan simulated maps than the Duchin Plans. In addition, the simulations show that the Enacted Plans contain one county grouping, the Guilford County grouping in the House of Representative, that is a partisan outlier. However, this grouping largely follows the boundaries of a 2019 court-approved district plan. In contrast, the Duchin Plans generate partisan outliers in four county groupings.

In the Senate analysis both the Enacted and Duchin plans generate partisan outliers when compared to the simulated district maps in two clusters each. Furthermore, neutral redistricting criteria such as following municipal lines support the decisions by the map drawers in the Enacted Plan in more districts, while in these same districts the Duchin Plan divides Democratic-leaning municipalities into more pieces in order to combine Democratic-

[1] These plans were attached to the NCLCV complaint, filed on November 16, 2021.

leaning voters in cities with Republican voters in suburban and rural parts of North Carolina to create additional competitive or Democratic-leaning districts. Given these results, as well as the otherwise high degree of agreement between the Enacted and Duchin maps, it is my opinion that the Enacted Maps are not "extreme partisan gerrymanders" as plaintiffs allege.

I am an associate professor of political science at Brigham Young University and faculty fellow at the Center for the Study of Elections and Democracy in Provo, Utah. I received my PhD in political science from Princeton University in 2014 with emphases in American politics and quantitative methods/statistical analyses. My dissertation was awarded the 2014 Carl Albert Award for best dissertation in the area of American Politics by the American Political Science Association.

I teach a number of undergraduate courses in American politics and quantitative research methods.[2] These include classes about political representation, Congressional elections, statistical methods, and research design.

I have worked as an expert witness in a number of cases in which I have been asked to analyze and evaluate various political and elections-related data and statistical methods. Cases in which I have testified at trial or by deposition are listed in my CV, which is attached to the end of this report. I have previously provided expert reports in a number of cases related to voting, redistricting, and election-related issues: *Nancy Carola Jacobson, et al., Plaintiffs, vs. Laurel M. Lee, et al., Defendants. Case No. 4:18-cv-00262 MW-CAS (U.S. District Court for the Northern District of Florida); Common Cause, et al., Plaintiffs, vs. Lewis, et al., Defendants. Case No. 18-CVS-14001 (Wake County, North Carolina); Kelvin Jones, et al., Plaintiffs, v. Ron DeSantis, et al., Defendants, Consolidated Case No. 4:19-cv-300 (U.S. District Court for the Northern District of Florida); Community Success Initiative, et al., Plaintiffs, v. Timothy K. Moore, et al., Defendants, Case No. 19-cv-15941 (Wake County, North Carolina); Richard Rose et al., Plaintiffs, v. Brad Raffensperger, Defendant, Civil Action No. 1:20-cv-02921-SDG (U.S. District Court for the Northern Dis-*

trict of Georgia); Georgia Coalition for the People's Agenda, Inc., et. al., Plaintiffs, v. Brad Raffensberger, Defendant. Civil Action No. 1:18-cv-04727-ELR (U.S. District Court for the Northern District of Georgia); Alabama, et al., Plaintiffs, v. United States Department of Commerce; Gina Raimondo, et al., Defendants. Case No. CASE NO. 3:21-cv-00211-RAH-ECM-KCN (U.S. District Court for the Middle District of Alabama Eastern Division); League of Women Voters of Ohio, et al., Relators, v. Ohio Redistricting Commission, et al., Respondents. Case No. 2021-1193 (Supreme Court of Ohio).

In my position as a professor of political science, I have conducted research on a variety of election- and voting-related topics in American politics and public opinion. Much of my research uses advanced statistical methods for the analysis of quantitative data. I have worked on a number of research projects that use "big data" that include millions of observations, including a number of state voter files, campaign contribution lists, and data from the US Census. I have also used geographic information systems and other mapping techniques in my work with political data.

Much of this research has been published in peer-reviewed journals. I have published nearly 20 peer-reviewed articles, including in our discipline's flagship journal, *The American Political Science Review* as well as the inter-disciplinary journal,*Science Advances*. My CV, which details my complete publication record, is attached to this report as Appendix A.

The analysis and opinions I provide in this report are consistent with my education, training in statistical analysis, and knowledge of the relevant academic literature. These skills are well-suited for this type of analysis in political science and quantitative analysis more generally. My conclusions stated herein are based upon my review of the information available to me at this time. I reserve the right to alter, amend, or supplement these conclusions based upon further study or based upon the availability of additional information. I am being compensated for my time in preparing this report at an hourly rate of $400/hour. My compensation is in no way contingent on the conclusions reached as a result of my analysis. The opinions in this report are my own, and do note represent the view of Brigham Young

University.

2 Summary of Conclusions

Based on the evidence and analysis presented below, my opinions regarding the 2021 enacted redistricting plans in the North Carolina General Assembly can be summarized as follows:

- The contemporary political geography of North Carolina is such that Democratic majorities are often geographically clustered in the largest cities of the state while Republican voters often dominate the suburban and rural portions of the state.
- This is not the case in the rural northeastern region of the state, where there are also significant Democratic majorities.
- This geographic clustering in cities an in the rural northeast puts the Democratic Party at a natural disadvantage when single-member districts are drawn.
- This is further amplified by the 'county grouping' process that is unique to North Carolina's redistricting process where districts are constrained to remain within county groups.
- This disadvantage partially arises from the difficulty, and in many cases impossibility, of drawing Democratic-leaning districts in many of the county groupings that comply with constitutional requirements, even though Democratic voters make up roughly 40% of voters in these parts of the state.
- Based on a comparison between the Enacted Plan, the Duchin Plan, and a set of 50,000 simulated maps, the Enacted Plan is less of a partisan outlier than the Duchin Plan in the State House. In 39 of the 40 clusters the Enacted Plan is not a partisan outlier in

comparison to the simulation results. In 36 of the 40 clusters the Duchin Plan is not a partisan outlier in comparison to the simulation results.

- In the Senate analysis both the Enacted and Duchin plans generate partisan outliers when compared to the simulated district maps in two clusters each.

- Areas of disagreement between proposed plans often arise because the Duchin plan divides Democratic leaning municipalities into more pieces in order to combine Democratic-leaning voters with Republican voters in suburban and rural parts of the state to create additional competitive or Democratic leaning districts.

- Given these results, as well as the otherwise high degree of agreement between the Enacted and Duchin maps, it is my opinion that the Enacted Maps are not "extreme partisan gerrymanders" as plaintiffs allege.

3 Political Geography of North Carolina

For the last several decades, North Carolina has been relatively competitive in statewide elections. Democratic and Republican candidates have won the state at the presidential, gubernatorial, congressional, and state level. Figure 1 below shows the results of the average of all statewide elections in North Carolina from 2000 through 2020. These races include: president, US Senate, governor, lieutenant governor, attorney general, secretary of state, state auditor, treasurer, superintendent, commissioner of agriculture, commissioner of labor, insurance commissioner, and partisan judicial elections in 2018.[3] While not all races are up for election in each year, I create the index by averaging the two-party vote share of those races that occurred in each two-year cycle. State-level races in North Carolina occur in presidential election years while US senate races occur every six years. There were no statewide partisan races in 2006. As can be seen in the figure, the statewide Democratic margin in North Carolina peaked in 2008 at 55% of the two-party vote and reached its nadir in 2010 with 44% of the vote.

The relative stability of the statewide results over the last 10 years masks a dramatic variation in the spatial location of Democratic and Republican voters within the state. The following section details this and shows in a variety of different ways that Democratic voters are more likely to be spatially clustered in the state while Republican voters tend to live in more politically diverse areas.

Scholarship in political science has noted that the spatial distribution of voters throughout a state can have an impact on the partisan outcomes of elections when a state is, by necessity, divided into a number of legislative districts. This is largely the case because Democratic-leaning voters tend to cluster in dense, urban areas while Republican-leaning voters tend to be more equally distributed across the remainder of the state.[4] One prominent

[3]To create the index I sum by party all votes cast for each candidate in each race by year. I then take the fraction of votes cast for candidates of the two major parties that were cast for Democratic candidates in that year. There are other possible measures and methods one could use, such as considering candidate percentages before averaging or including third party voters.

[4]See for example Stephanopoulos, N. O. and McGhee, E. M., Partisan Gerrymandering and the Efficiency

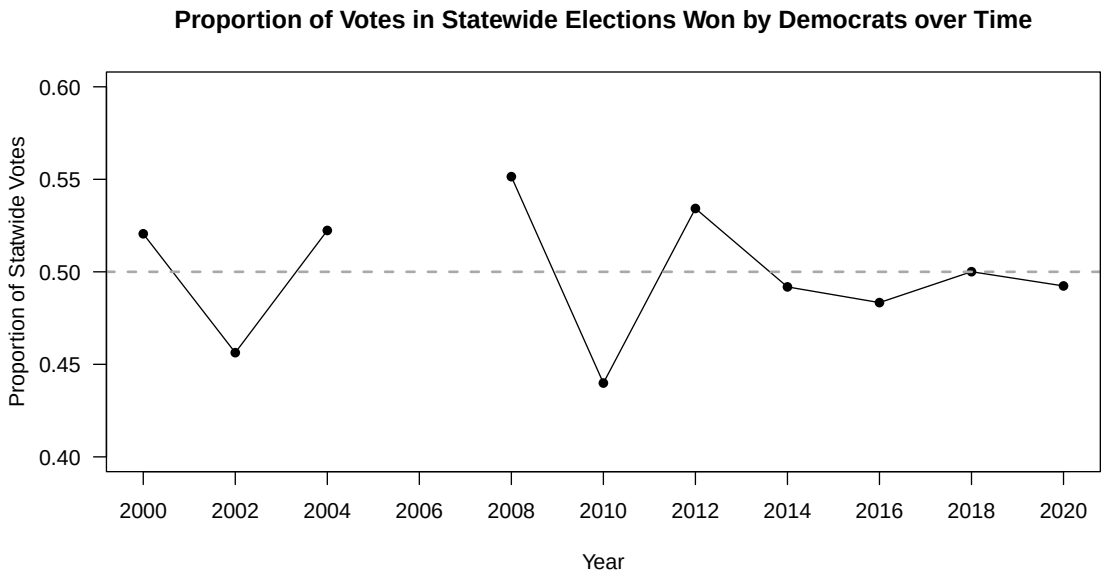

Figure 1: **Democratic Proportion of Statewide Election Contests, 2000-2020**

study of the topic (Chen and Rodden, 2013) finds that "Democrats are highly clustered in dense central city areas, while Republicans are scattered more evenly through the suburban, exurban, and rural periphery...Precincts in which Democrats typically form majorities tend to be more homogenous and extreme than Republican-leaning precincts. When these Democratic precincts are combined with neighboring precincts to form legislative districts, the nearest neighbors of extremely Democratic precincts are more likely to be similarly extreme than is true for Republican precincts. As a result, when districting plans are completed, Democrats tend to be inefficiently packed into homogenous districts."[5]

The upshot of this pattern is that political parties stand at a disadvantage when their voters are not "efficiently" distributed across the state. To understand what I mean

by efficient, imagine two different scenarios. First, imagine a party with a slim majority of voters statewide in which every precinct's vote share perfectly reflected the overall state. In other words, the party has a slight majority in every precinct that adds up to a slight majority statewide. In this case, this party's voters are extremely efficiently distributed in such a way that the party will win every single district despite only a slim majority statewide. Now imagine a different arrangement, a party who still holds a slim majority statewide, but whose voters are heavily concentrated in a few areas and sparsely populated throughout the rest of the state. In this case, despite holding a majority of votes statewide, the party will only win a few seats where their voters are heavily concentrated. The political geography of North Carolina more closely resembles the second scenario.

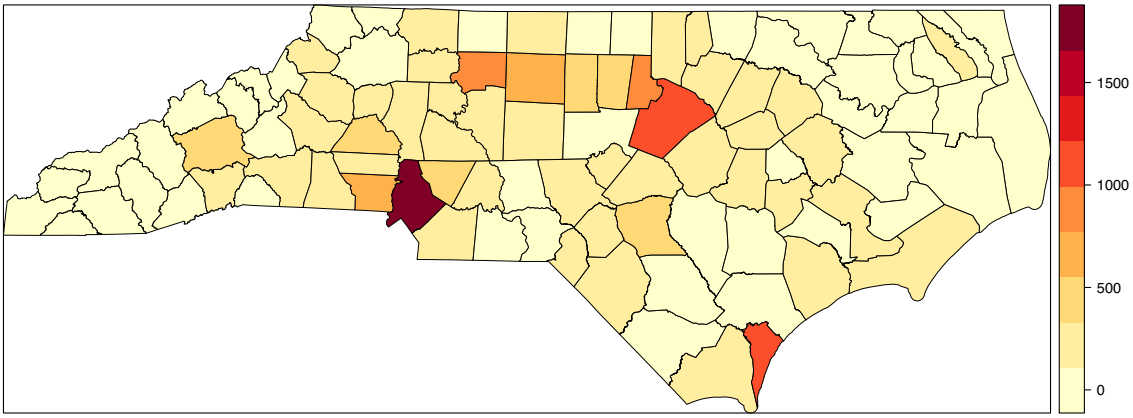

Figure 2 shows two maps of North Carolina. The top map shows the population density across counties. The bottom map shows the distribution of partisan preference across the state. Comparing the two shows that the most dense and urban counties (Wake, Mecklenburg, Durham, Guilford, Forsyth, New Hanover) in the state tend to also be where we see clusters of Blue on the bottom map.

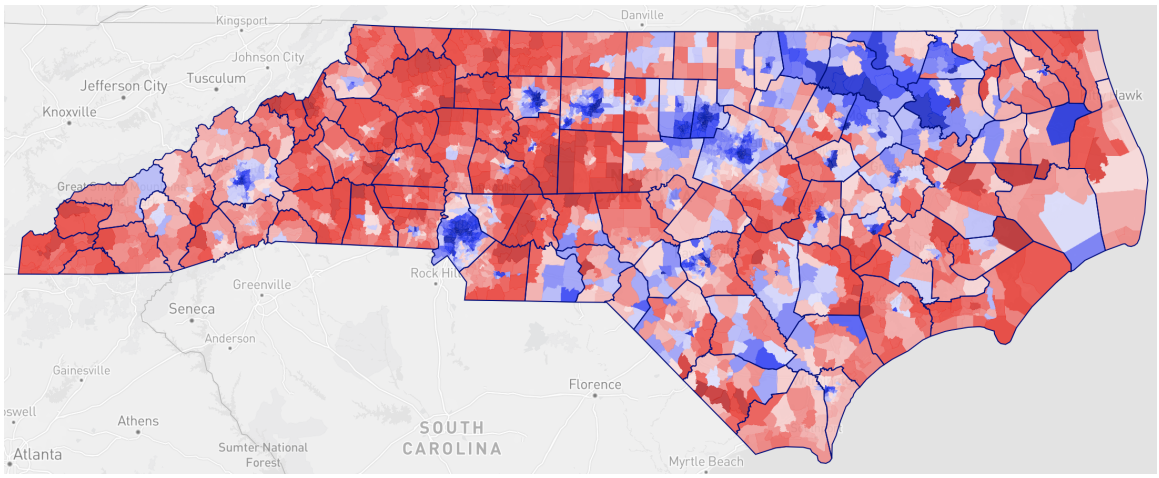
North Carolina adds an additional wrinkle to this trend that also works to create heavily Democratic state legislative districts. Figure 2 shows that the rural counties of north eastern North Carolina are strongly Democratic.[6] This further works to facilitate the creation of strongly Democratic state legislative districts because each of these rural counties, and sometimes in combination with other adjacent rural counties, can form a legislative district. This is because the state constitution again emphasizes that counties be kept together when drawing district boundaries, and when grouping counties to collect a sufficient number of people, the minimum grouping of contiguous counties should be used. Because these rural counties all share the common feature of being strongly Democratic, any grouping of these counties together will further generate legislative districts with large majorities in support of Democratic candidates.



[6]This would include Vance, Warren, Halifax, Northampton, Hertford, Bertie, and Edgecomb counties.

Figure 2: **Distribution of People and Partisan Preferences in North Carolina.**

(a) Population Density of North Carolina Counties

(b) Partisan Preferences in North Carolina Counties

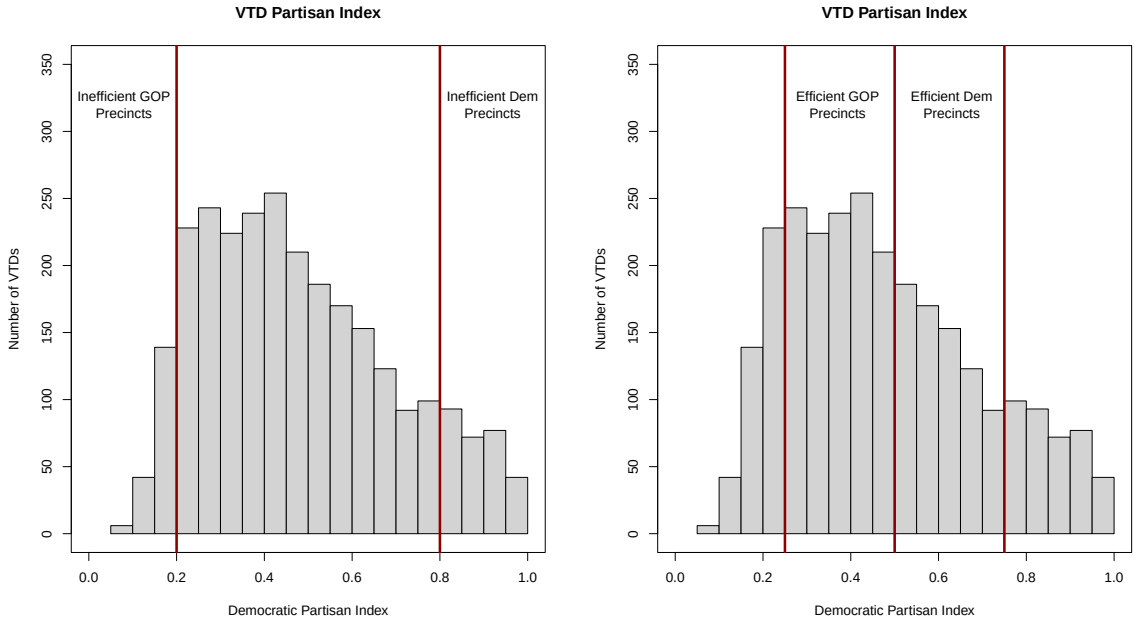
Note: Blue = Democratic, Red = Republican

Thus, the geographic concentration of a party's voters tends to harm that party when single-member districts are drawn by creating districts that favor that party by very large majorities, thus 'wasting' many votes in running up large majorities far beyond 50%+1.[7] This occurs in North Carolina in the urban counties of the state as well as the northeastern counties of the state where there are also sizeable Democratic majorities. Importantly, the discussion is not about *where* Democratic voters are heavily clustered together, but simply that they are. It is less important if this clustering takes place in large urban cities or in

[7]McGhee, E. (2017). Measuring Efficiency in Redistricting. Election Law Journal: Rules, Politics, and Policy, 16(4), 417–442. doi:10.1089/elj.2017.0453

rural portions of the state. The overwhelming margins for the party are what drives 'wasted votes,' which, in turn translate to fewer seats than the statewide proportion of the vote would suggest.

Another way to consider this is to look at a lower level of geography, the Voter Tabulation District (VTD), which is similar to a precinct. Figure 3 shows the distribution of partisan preferences for 11 statewide partisan elections for all VTDs in North Carolina.[8] The left panel notes VTDs where there are strong majorities for either party and labels them as "inefficient" VTDs. They are inefficient based on the discussion above that a party wastes votes if it builds majorities far beyond the needed 50%+1. Note that the distribution is not symmetric and that there are more VTDs with very large democratic majorities than there are VTDs with equally large Democratic majorities. The right panel shows the same distribution by labels "efficient" VTDs — those where a party has a majority, but not an overwhelming majority. Note here that there are many more VTDs with efficient Republican majorities than there are VTDs with efficient Democratic majorities.



This inefficient distribution of votes would not be a problem for Democrats if districts were able to amble about the state so as to create districts that had less overwhelming Democratic support. Rodden (2019) notes this by saying: "Democrats would need a redistricting process that intentionally carved up large cities like pizza slices or spokes of a wheel, so as to combine some very Democratic urban neighborhoods with some republican exurbs in an effort to spread Democrats more efficiently across districts (pg. 155).[9]" Alternatively, as districts get larger in size (i.e. congressional districts) "Democratic communities can easily string together and overwhelm the surrounding rural Republicans (pg. 149)." However, the laws governing redistricting in North Carolina run counter to either of these strategies.

[8] I use these elections because they were the most comprehensive set of statewide elections I could obtain, given the tight time constraints, that were aggregated and matched to the level of the VTD. The elections are 2020: President, Senate, Governor, Lieutenant Governor, Attorney General; 2016: President, Senate, Governor, Lieutenant Governor, Attorney General; 2014: Senate.

[9] Rodden, Jonathan A. Why cities lose: The deep roots of the urban-rural political divide. Hachette UK, 2019.. While Rodden is specifically discussing Pennsylvania in this quote, the statement is true of any location with Democrats clustered in urban areas.

Figure 3: **Distribution of Votes Across VTDs in North Carolina.**

(a) Inefficient VTDs (b) Efficient VTDs

Note: Partisan Index based on the average of 11 statewide partisan races between 2014-2020.

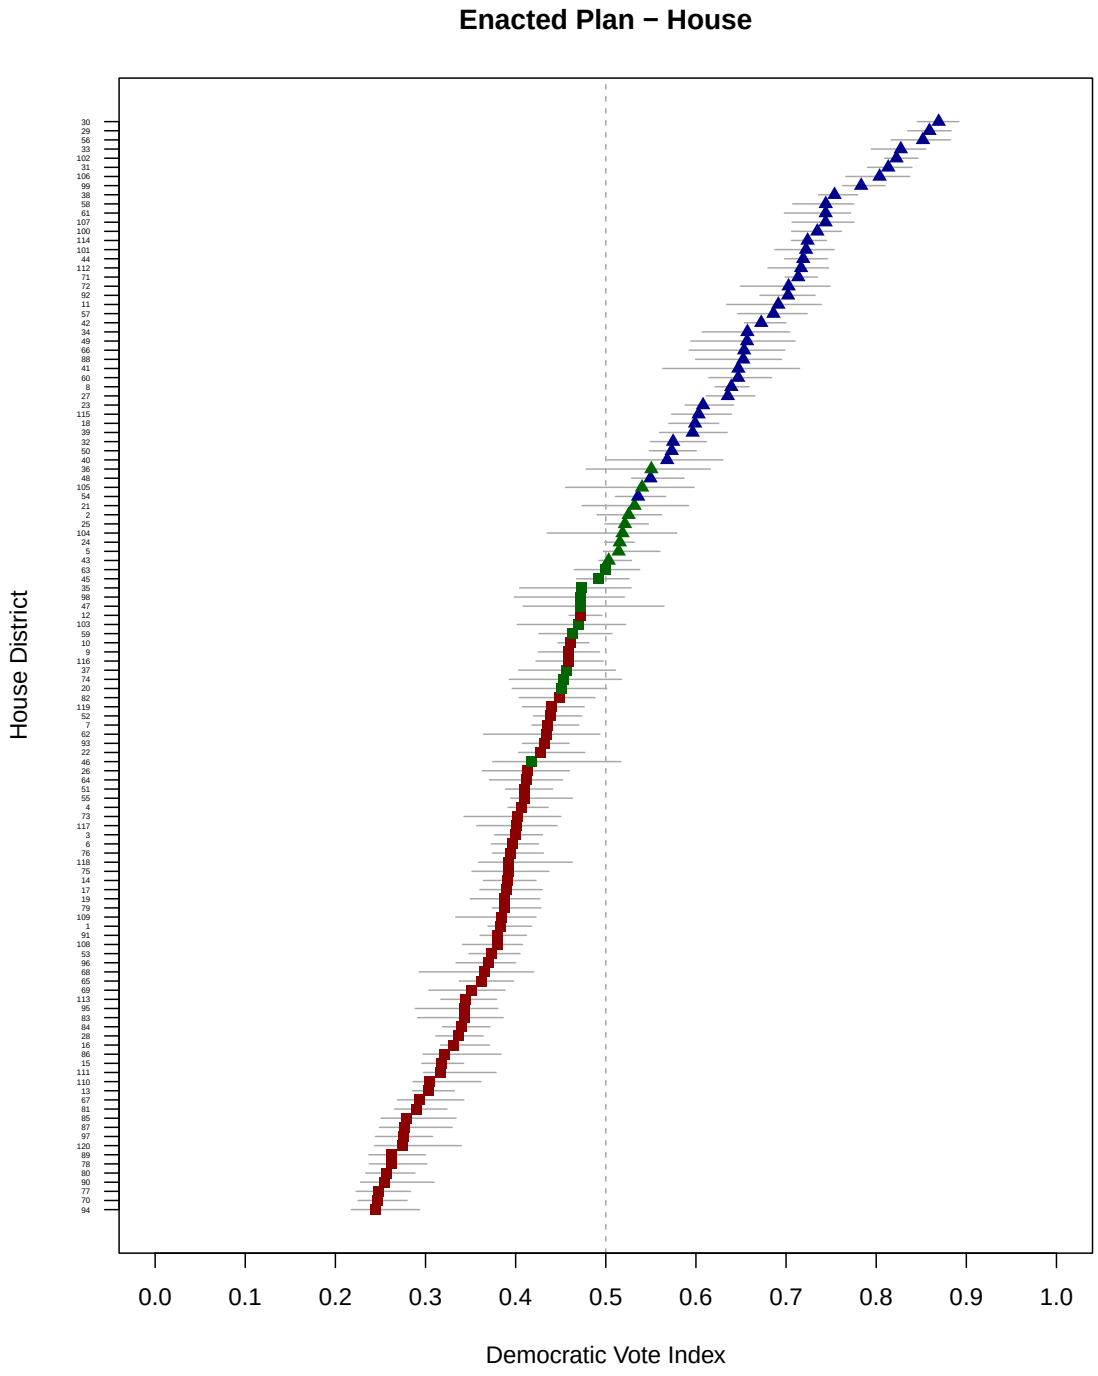
North Carolina's strict rules that require districts to remain within pre-determined county clusters prohibit the type of meandering districts that Rodden describes above. Furthermore, additional restrictions requiring geographic compactness and minimizing the splitting of municipalities further eliminates the possibility of taking the strategy described above. In the end, this means that Republicans begin the redistricting process with a natural advantage due to the combination of laws requiring where and how districts are drawn combined with the particular spatial distribution of their voters. Thus, as I will show below, the advantage we observe between the expected Republican seat share in the state legislature compared to the statewide Republican vote share in the recent past is more due to geography than partisan activity by Republican map drawers.[10]

[10]Rodden (2019) notes regarding North Carolina, "Due to the presence of a sprawling knowledge-economy corridor, a series of smaller automobile cities with relatively low partisan gradients, and the distribution of rural African Americans, Democrats are relatively efficiently distributed in North Carolina at the scale of congressional districts (pg. 173)." It is important to note that this statement is not true for state legislative districts, which contain much smaller populations than congressional districts (and thus often cannot span

To measure the expected seat share in the state House and Senate, I compute a partisan index of statewide elections for 11 statewide partisan elections between 2014-2020.[11]

Figure 4 shows this for the 120 House seats. Districts are ordered from least Democratic at the bottom to most Democratic at the top. Districts with a partisan index less than 0.50 (i.e. Republican leaning) are shown as squares and districts with a partisan index greater than 0.50 (i.e. Democratic leaning) are displayed as triangles. In the House there are 71 districts with an index less than 0.50 (shown as squares) and 49 districts with an index greater than 0.50 (shown as triangles). A vertical dashed line is placed at 0.50 in each panel for reference. The grey lines around each point show the range of election outcomes for all of the 11 statewide elections used to generate the index. Districts in which the Republican candidate for statewide elections won the majority of the two-party vote share in all 11 races are colored red while districts where the Democratic candidate for statewide elections won the majority of the two-party vote share in all 11 races are colored blue. Districts where both parties have won a majority of the two-party vote share in these 11 races are colored green. Looking at the range across the index, there are 60 districts colored red (reliably Republican) in the House figure, 40 blue districts (reliable Democratic), and 20 green districts (competitive) in the House map. Using an alternative definition of competitiveness based on the closeness of the index to 0.50, there are 57 districts with an index less than 0.45, 24 districts between 0.45 and 0.55 (a commonly used range to define competitive seats), and 39 districts with an index of greater than 0.55.

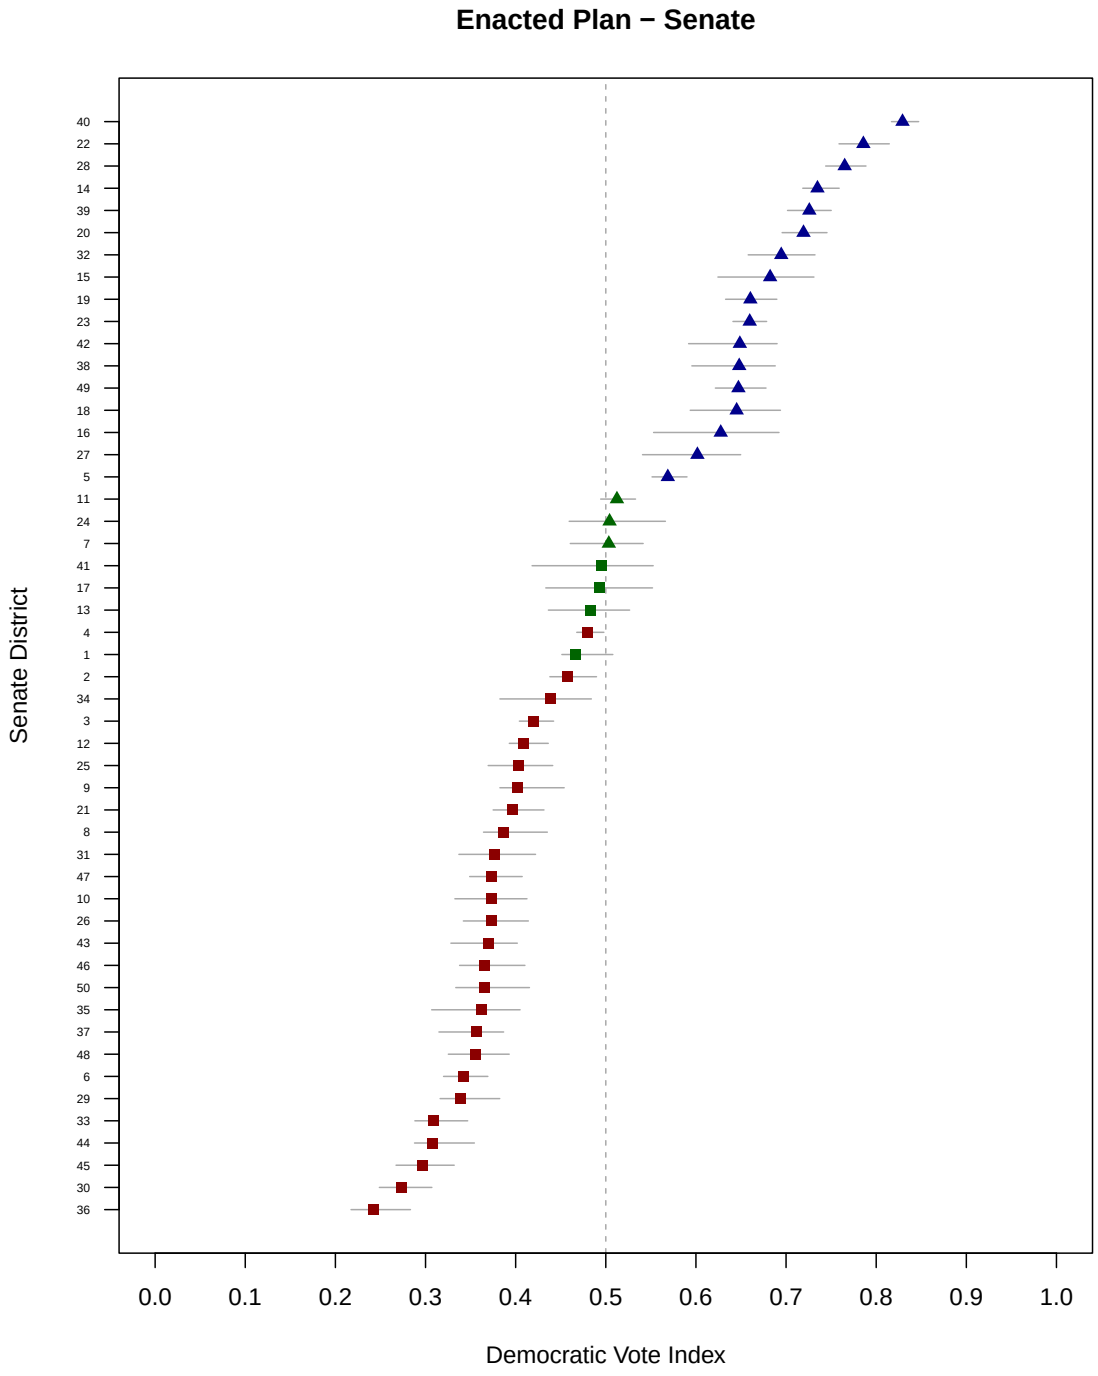
Using the same method for the Senate, there are 30 squares (i.e. Republican leaning districts) and 20 triangles in the figure (i.e. Democratic leaning districts). Using the color scheme described above, there are 26 red districts (reliably Republican), 17 blue districts (reliable Democratic), and 7 green districts in the Senate map (competitive). Using an alternative definition of competitiveness based on the closeness of the index to 0.50, there



across multiple cities) and are much more constrained to remain within the county clusters, unlike the congressional district maps.

[11]The elections are 2020: President, Senate, Governor, Lieutenant Governor, Attorney General; 2016: President, Senate, Governor, Lieutenant Governor, Attorney General; 2014: Senate

are 24 districts with an index less than 0.45, 17 districts between 0.45 and 0.55, and 9 districts with an index of greater than 0.55. Figure 5 shows this for the 50 Senate seats.



When looking at these figures, we cannot make any immediate determinations about why this distribution of seats, which has more Republican leaning districts than Democratic leaning districts, does not exactly reflect the statewide of average of votes in the state, which is much closer to parity between the parties. The reason for this is that, as discussed above, the distribution of voters who favor one party or the other is not even across the state. Furthermore, districts in North Carolina are restricted to remain within the pre-determined county clusters, further complicating the connection between district boundaries and statewide vote shares. This unique feature of North Carolina's redistricting process significantly constrains any map maker and can furthermore exacerbate the geographic disparities that exist across the state.

Figure 4: **Partisan Index of Senate Districts in 2021 Enacted Plan**

Note: Partisan Index based on the average of 11 statewide partisan races between 2014-2020. Districts with a partisan index less than .50 (i.e. Republican leaning) are shown as squares and districts with a partisan index greater than .50 (i.e. Democratic leaning) are displayed as triangles. A vertical dashed line is placed at .50 in each panel for reference. The grey lines around each point show the range of election outcomes for all of the 11 statewide elections used to generate the index. Districts in which the Republican candidate for statewide elections won the majority of the two-party vote share in all 11 races are colored red while districts where the Democratic candidate for statewide elections won the majority of the two-party vote share in all 11 races are colored blue. Districts where both parties have won a majority of the two-party vote share in these 11 races are colored green.

Figure 5: **Partisan Index of Senate Districts in 2021 Enacted Plan**

Note: Partisan Index based on the average of 11 statewide partisan races between 2014-2020. Districts with a partisan index less than .50 (i.e. Republican leaning) are shown as squares and districts with a partisan index greater than .50 (i.e. Democratic leaning) are displayed as triangles. A vertical dashed line is placed at .50 in each panel for reference. The grey lines around each point show the range of election outcomes for all of the 11 statewide elections used to generate the index. Districts in which the Republican candidate for statewide elections won the majority of the two-party vote share in all 11 races are colored red while districts where the Democratic candidate for statewide elections won the majority of the two-party vote share in all 11 races are colored blue. Districts where both parties have won a majority of the two-party vote share in these 11 races are colored green.

4 Introduction to Simulations Analysis

To gauge the range of partisan outcomes in the North Carolina General Assembly, I conduct simulated districting analyses to allow me to produce a large number of districting plans that follow traditional districting criteria using small geographic units as building blocks for hypothetical legislative districts (voting tabulation districts, or VTDs). This simulation process ignores all partisan and racial considerations when drawing districts. Instead, the computer simulations are programmed to create districting plans that follow traditional districting goals without paying attention to partisanship, race, or the location of incumbent legislators.

The process of simulating districting plans has been recognized and used in a variety of redistricting cases, including in North Carolina.[12] While different people employ slightly different methods, the overall process is much the same. For my simulations, I use a program developed by Fifield et al. (2020).[13]

A significant advantage of the simulation-based approach in general is the ability to compare a proposed map to a set of maps that are drawn without consideration of criteria such as partisanship or race. If the proposed map is similar to the set of simulated maps, it is reasonable to assume that the proposed map was not drawn primarily with partisan intent. If the map differs from the simulations, it is important to recognize that a variety of factors could have played into the deviation, but the underlying idea is that a deviation from the simulations reflects a choice by the map-maker to prioritize some factor that was not

[12]See League of Women Voters of Ohio v. Ohio Redistricting Commission (2021); Harper v. Hall (2021); Common Cause v. Lewis (2019); Harper v. Lewis (2019); League of Women Voters of Pennsylvania v. Commonwealth of Pennsylvania (2018).

made a priority in the simulations. This could include partisanship, but could also include incumbency protection, preservation of media markets, keeping particular counties, cities, or neighborhoods together that have historically been joined in districts, or some other factor that is important to a map maker or legislator involved in the process.

A major factor in the validity of the simulated maps is whether or not they constitute a representative sample of the trillions of possible maps that could be drawn.[14] If the sample produced by the simulations is not representative, then we may be comparing a proposed map to a biased selection of alternative maps, which renders the value of the comparison meaningless.

A specific benefit of the particular algorithm I use here is that the authors show mathematically and in a small-scale validation study that their method produces a representative sample of maps. With regards to this issue, the authors state:

> Yet, until recently, surprisingly few simulation algorithms have existed in the published scholarship. In fact, most of these existing studies use essentially the same Monte Carlo simulation algorithm where a geographical unit is randomly selected as a "seed" for each district and then neighboring units are added to contiguously grow this district until it reaches the pre-specified population threshold (e.g., Cirincione, Darling, and O'Rourke 2000; Chen and Rodden 2013). Unfortunately, no theoretical justification is given for these simulation algorithms, and hence they are unlikely to yield a representative sample of redistricting plans for a target population....Unlike the aforementioned standard simulation algorithms, the proposed algorithms are designed to yield a representative sample of redistricting plans under contiguity and equal population constraints.[15]

[15]Cirincione, C., Darling, T. A., and O'Rourke, T. G. (2000), "Assessing South Carolina's 1990s Congressional Districting," Political Geography, 19, 189–211. DOI: 10.1016/S0962-6298(99)00047-5. Chen, J., and

With a representative set of maps in hand, we can then analyze the difference between the proposed map and the simulated maps on a variety of metrics. As discussed above, it is well established that the party whose voters are more geographically compact stands at a natural disadvantage when single member districts are drawn. "The party that's more spread out has a geographic advantage," says applied mathematician Jonathan Mattingly of Duke University. "That's our system.[16]" The comparison between the simulated districts and the proposed map overcomes this hurdle and allows for an apples-to-apples comparison that accounts for the unique political geography of a state, such as the spatial distribution of voters or the location and number of administrative boundaries, such a counties. Simulation methods can also incorporate a state's other unique redistricting rules. The simulation-based approach therefore permits us to compare a particular plan to a large number of representative districting plans in the North Carolina House and Senate using criteria specific to North Carolina. In the simulations I run, I instruct the model to generate plans that adhere to the restrictions included in the North Carolina Constitution as well as the *Stephenson* criteria of roughly equal population, adherence to county cluster boundaries, minimization of county traversals within clusters, and geographic compactness.

Specifically, the model is constrained to conduct 50,000 simulations separately in each county cluster by assembling VTDs into districts that meet the redistricting criteria of equal population, contiguity, compactness, and minimal county and municipal divisions.[17] Within each cluster the model generates 50,000 maps with the number of districts equal to the number of districts allocated to that cluster that are of roughly equal population ($< 5\%$ deviation above or below the target population of 86,995 in the House and 208,788 in the Senate). The model is also instructed to generate districts that cross county boundaries as few times as possible. Of course, county populations do not always add up to round units

Rodden, J. (2013), "Unintentional Gerrymandering: Political Geography and Electoral Bias in Legislatures," Quarterly Journal of Political Science, 8, 239–269. DOI: 10.1561/100.00012033.

[16]https://www.sciencenews.org/article/gerrymandering-elections-next-gen-computer-generated-maps

[17]The simulations are not allowed to split VTDs as this is the lowest level of geography for which I have election results.

of districts, and so of necessity some county boundaries will be split. The model is further instructed that when a county boundary needs to be crossed, it should avoid splitting the county more times than necessary. After the model is run, I discard any simulations that include more county traversals than the Enacted Plan.

I also instruct the model to generate districts that are geographically compact. After the model is run, I compute the average geographic compactness of the simulated districts in the county cluster and compare that to the average geographic compactness of the Enacted Plan. I use the Polsby-Popper measure of compactness, which is a common measure of geographic compactness.[18] After the model is run, I also discard any simulations that are less compact, on average, than the Enacted Plan.

The final constraint is an instruction to avoid splitting municipal boundaries. This constraint is second order to the constraint to avoid county boundaries. In other words, the model prioritizes avoiding county splits over municipal splits. Once the county split constraint is accounted for, then the model places priority on avoidance of municipal splits. Because municipalities and VTDs do not perfectly overlap, it is difficult to calculate the exact number of municipal splits from the model. I make a simplifying assumption and assign each VTD to a municipality if any part of the VTD intersects that municipality. Furthermore, if a VTD overlaps multiple municipalities, I assign the VTD to the municipality in which the most area of the VTD is contained. In a few cases a city spans multiple counties. Here I consider each portion of the city as a separate municipality.

Once the simulated district plans are complete, I then compute the partisan lean of each district in each plan. For the partisan composition of each district I rely on the two-party election results from statewide elections disaggregated to the level of the VTD. I then reassemble these election results at the district level to compute the proportion of votes

[18]The Polsby-Popper measure is computed by taking is the ratio of the area of the district to the area of a circle whose circumference is equal to the perimeter of the district. A district's Polsby-Popper score falls with the range of [0,1] and a score closer to 1 indicates a more compact district. Polsby, Daniel D., and Robert D. Popper. 1991. "The Third Criterion: Compactness as a procedural safeguard against partisan gerrymandering." Yale Law & Policy Review 9 (2): 301–353.

in each statewide election that were won by the Democratic and Republican candidates in those districts. I compute the index of district partisanship using the two-party vote share in eleven elections from the past ten years.[19] The index is an average of all eleven of these statewide races in North Carolina from 2012-2020. Averages of multiple elections have the benefit of "washing out" the impact of any particular election, since individual elections can vary due to particular candidate features and other idiosyncrasies and particular years can vary due to national electoral waves (i.e. 2020 was a good electoral year for Democrats while 2016 was a good year for Republicans nationwide). As such, my preferred metric is the partisan index. However, I also compute the two-party vote share for each of the 11 statewide elections individually and report these as well for completeness. Occasionally, seeing how a plan or set of simulations varies across individual elections can shed light on the variation and shifts in political preferences in a locality.

5 NC House Analysis

A unique feature of the redistricting process in North Carolina is the use of "county grouping (or clusters)" wherein redistricting takes place entirely inside of each cluster. In essence, this means that the process of redistricting the state House (or Senate) in North Carolina is not a single problem in which a map maker draws 120 (or 50 for the Senate) districts throughout the state. Instead, the map maker faces many distinct redistricting problems that are all self contained. Cooper et al. (2021, "The Duke Study"), have addressed this issue using the 2020 census data and reported on the optimal set of clusters in both the House and Senate. They state, "Determining the county clusters for the NC House and for the NC Senate is the first step in the redistricting process for the NC General Assembly. The county clusters are largely algorithmically determined through an optimization procedure

[19]The particular races are 2020: President, US Senate, Governor, Lieutenant Governor, and Attorney General; 2016: President, US Senate, Governor, Lieutenant Governor, and Attorney General; 2014: US Senate. There are other partisan statewide races in these years, but I was unable to locate election results disaggregated to the VTD level.

outlined by the NC Supreme Court in *Stephenson v. Bartlett*.[20]" While there are a few choices that a map maker can make in choosing between different sets of clusters, the county cluster design significantly constrains any map maker as he or she is forced to work only within the counties contained in a given cluster. Because of this, any analysis of the Enacted Plan must consider each cluster separately, as they are independent of one another.

In the state House, there are 40 county clusters. 33 clusters containing 107 of the 120 districts are fixed based on the county cluster arrangement determined by Cooper et al. (2021, "Duke Study"). The remaining 7 clusters were selected by the General Assembly from three sets of choices between clusters.

5.1 House Groupings with only 1 District

Of the 40 county clusters, there are 13 of them composed of 31 counties in which the cluster contains only 1 House district. In these clusters there is no discretion for any map maker. The district is simply the boundaries of the county cluster. These counties collectively have a population of 1,128,328, or approximately 11% of the state's total population and account for 13 of the 120 seats in the state House.

Figure 6 shows a map of the counties that constitute these single-district clusters. Table 1 below shows each cluster, the counties included in the cluster, and the corresponding districts in the House Enacted Plan. The final two columns of the table show the partisan lean of the cluster using the 11 statewide partisan elections index discussed above and whether or not, based on that index, the cluster leans Democratic (or Republican). I classify a district (in the Enacted Plan and in the simulations as well) as being Democratic leaning if the partisan index for that district is greater than 0.50. In other words, if more than fifty percent of the ballots cast for the two major parties were for Democratic candidates, that district is classified as a Democratic leaning district. Obviously, districts with index values much larger than (smaller than) 0.50 will be more likely to elect a Democrat (Republican)

[20] https://sites.duke.edu/quantifyinggerrymandering/files/2021/08/countyClusters2020.pdf

than districts that are very close to 0.50.

The bottom row of the Table 1 shows the results for all 13 clusters together. Collectively these counties have a partisan index of 0.43, meaning roughly four in ten voters in these counties cast ballots for Democratic candidates in the 11 statewide races I consider here. However, the location of voters for the different parties is not uniformly distributed across these counties. Given this spatial distribution of voters across the counties, 4 of the 13 clusters lean Democratic, or roughly 30 percent. In this case, the proportion of Democratic leaning districts is lower that the proportion of voters in these counties who favor Democratic candidates. However, this is not due to any district boundaries. It is purely a function of the political geography of the state since all of these districts are entire county units and are, as such, fixed.

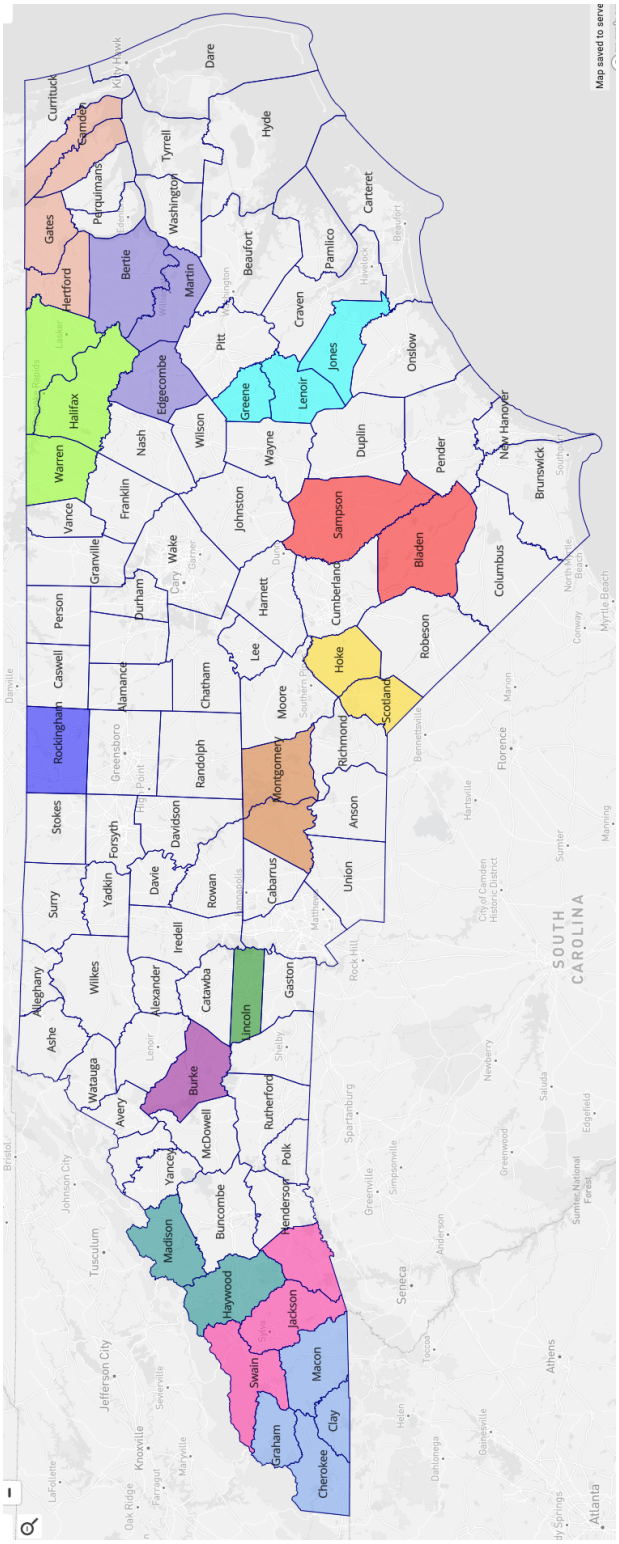

Figure 6: **Map of Counties and County Clusters with only 1 House District**

Table 1: County Grouping Containing 1 House District

County Cluster	# Counties	# Districts	District #	County Cluster Democratic Partisan Index	# of districts that are Democratic leaning
Rockingham	1	1	65	0.36	0
Lincoln	1	1	97	0.28	0
Burke	1	1	86	0.32	0
Bladen-Sampson	2	1	22	0.43	0
Hoke-Scotland	2	1	48	0.55	1
Haywood-Madison	2	1	118	0.40	0
Montgomery-Stanly	2	1	67	0.30	0

Halifax-Northampton-Warren	3	1	27	0.64	1
Cherokee-Clay-Graham-Macon	4	1	120	0.28	0
Camden-Gates-Hertford-Pasquotank	4	1	5	0.52	1
Total:	31	13		0.43	4

6 House Groupings with More than 1 District:

There are 27 county clusters that contain multiple districts where a map drawer has some discretion to draw district boundaries. I consider each cluster separately in the simulations analysis because the districts are constrained to remain within each county cluster.

These clusters collectively account for 107 of the 120 districts in the North Carolina House of Representatives. In addition to calculating the number of Democratic leaning districts for the Enacted Plan, I also compute the same partisan index for the plaintiffs proposed map (hereafter, 'Duchin Map') and compare how the Enacted Map and the Duchin Map perform on this same metric.[21] An overview of the results are as follows. In these 107 districts, the Enacted Plan creates 62 districts that lean Republican and 45 districts that lean Democratic according to the statewide partisan elections index. The Duchin Plan creates 52 districts that lean Republican and 52 districts that lean Democratic according to the statewide partisan elections index.

I then place both maps in relation to the distribution of partisan outcomes from the simulated districts. In each cluster I consider the number of Democratic districts generated by each plan in comparison to the distribution of results from the simulations. I consider a plan to be a partisan outlier if the number of Democratic districts generated by the plan falls outside the middle 50% of simulation results. This is a conservative definition of an outlier. In the social sciences, medicine, and other disciplines it is traditional to consider something an outlier if it falls outside the middle 95% or 90% of the comparison distribution.

In 26 of the 27 clusters, the Enacted Map produces a number of Democratic districts that falls within the middle 50% of simulation results and are not partisan outliers. This leaves 1 cluster in which the Enacted Plan is a partisan outlier in comparison to the simulation results.[22] The Enacted Map also produces the same number of Democratic leaning districts as the modal (most common) number of Democratic leaning districts in the simulations in

[21] Plaintiffs refer to this as an "optimized map." It is unclear what this means as optimization is a choice made by the researcher as to which factors to prioritize at the expense of others.

[22] This occurs in Guilford County.

22 of the 27 clusters.

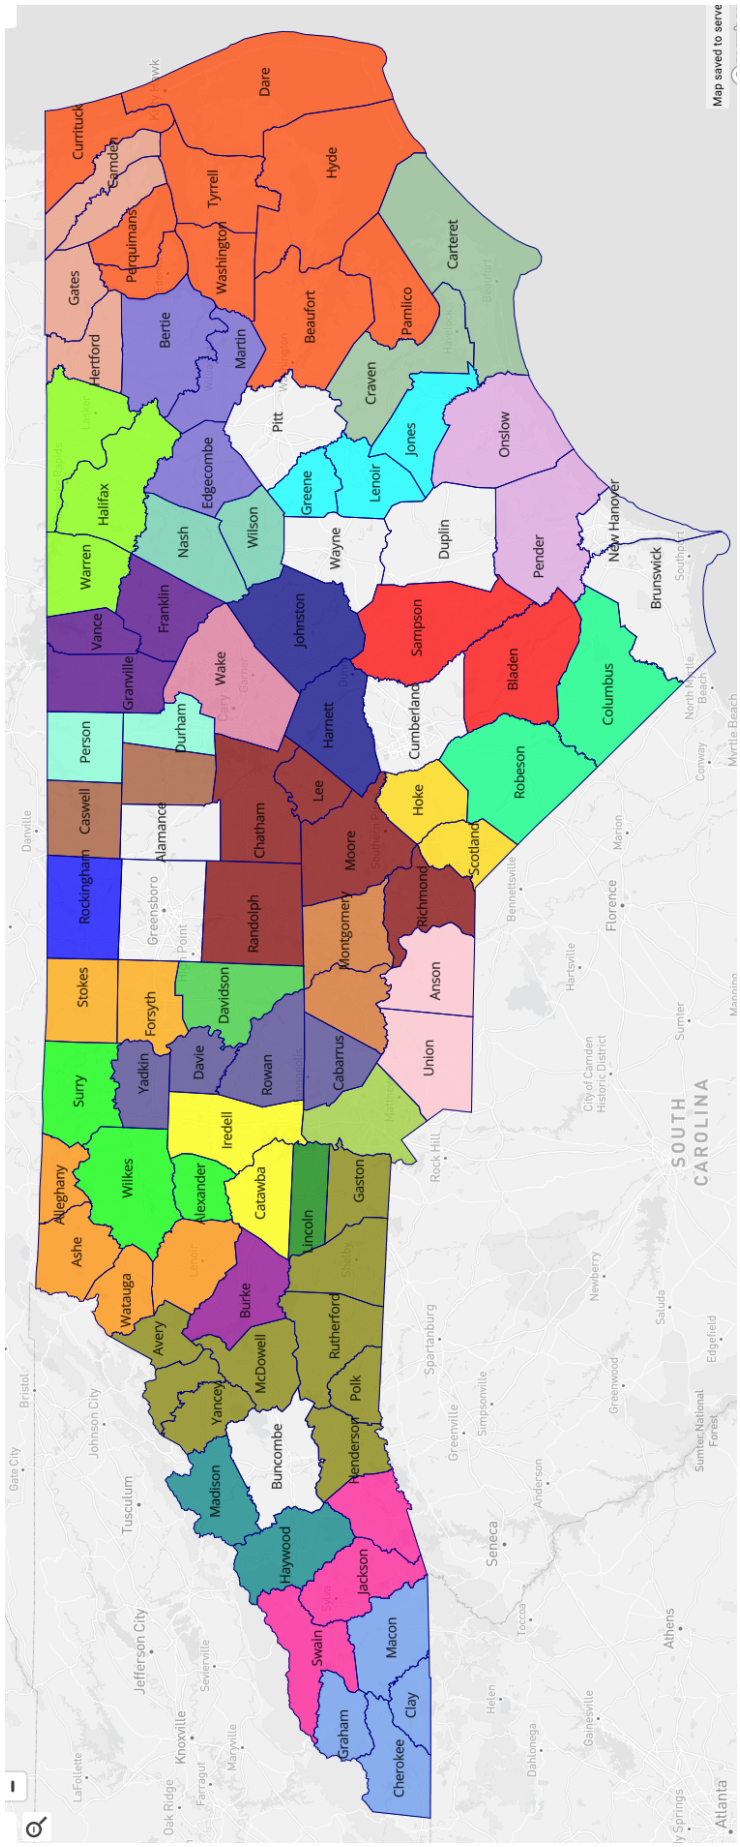
In 23 of the 27 clusters, the Duchin Map produces a number of Democratic districts that fall within the middle 50% of simulation results and are not partisan outliers. This leaves 4 clusters in which the Duchan Plan is a partisan outlier in comparison to the simulation results.[23] This is three more clusters that are partisan outliers than the Enacted Map. The Duchin Map also produces the same number of Democratic leaning districts as the modal (most common) number of Democratic leaning districts in the simulations in 20 of the 27 clusters.

By these metrics the Duchin Map is less in alignment with the results of the non-partisan simulations than the Enacted Map and is a greater partisan outlier.

In 20 of the 27 clusters the Enacted Map and the Duchin map are in agreement on the number of Democratic leaning districts.[24] This means there is disagreement in 7 of the 40 total clusters. Figure 7 shows a map of the locations in which the Enacted Plan and the Duchin Plan are in agreement on the number of Democratic leaning districts. Figure 8 shows a map of the locations in which the Enacted Plan and the Duchin Plan disagreement on the number of Democratic leaning districts.

Table 2 summarizes the results of the simulation analysis for these 27 House clusters with multiple districts. Thereafter, I present the results cluster-by-cluster.

[23]These are Brunswick-New Hanover, Cumberland, Duplin-Wayne, and Pitt



[24]These county groupings are: Davidson, Columbus-Robeson, Carteret-Craven, Nash-Wilson, Caswell-Orange, Alexander et al., Franklin et al., Alleghany et al., Beaufort et al., Anson-Union, Onslow-Pender, Harnett-Johnston, Catawba-Iredell, Durham-Person, Forsyth-Stokes, Cabarrus et al., Chatham et al., Avery et al., Mecklenburg, and Wake.

Table 2: House County Grouping Analysis Summary

			# of Districts that are Democratic Leaning		
County Cluster	**Cluster Democratic Partisan Index**	**# Districts**	**Enacted Map**	**Duchin Map**	**Simulations**
Davidson	0.27	2	0	0	0
Pitt	0.54	2	1	**2**	1

Guilford	0.61	6	**4**	5	5
Avery-Cleveland-Gaston-Henderson-McDowell-Mitchell-Polk-Rutherford-Yancey	0.35	7	0	0	0
Mecklenburg	0.65	13	11	11	11-12
Wake	0.61	13	11	11	11-12
Total:		107	45	52	46-51

Note: Number of Democratic leaning districts is measured using the average two-party vote share in each district from the 11 statewide races noted earlier. Simulations range represents the middle 50% of outcomes from the simulations results. There are no simulations results conducted in Carteret-Craven cluster, see later section for explanation. Groupings where a plan falls outside the middle 50% range of the simulations are bolded.

Figure 7: Map of House County Clusters Where Enacted and Duchin Plans Agree on Partisan Lean of Districts

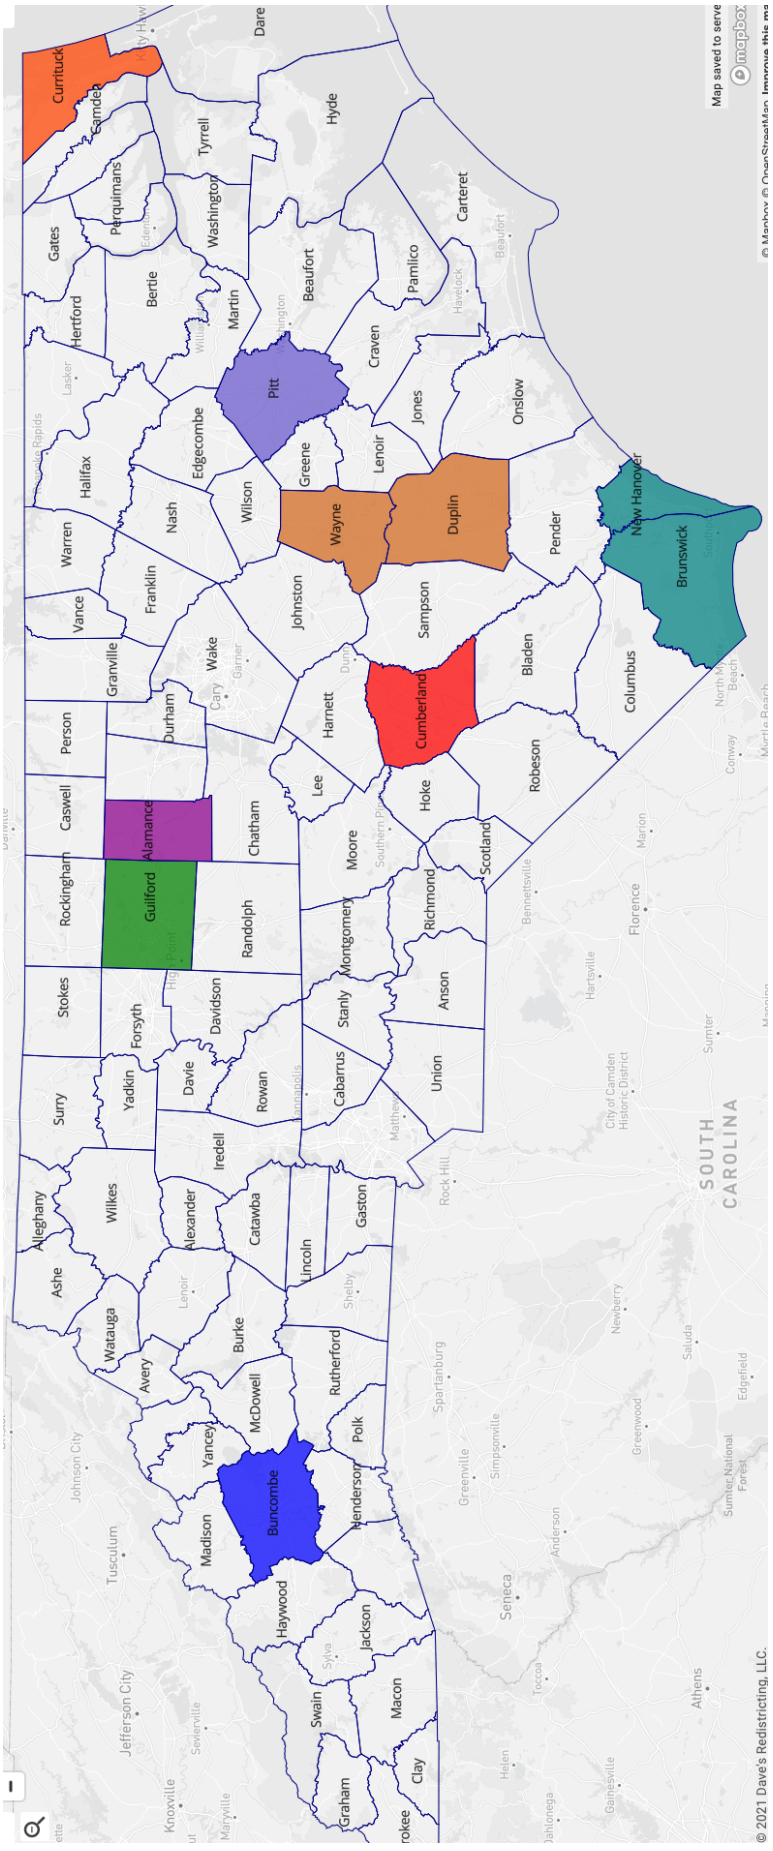

Figure 8: **Map of House County Clusters Where Enacted and Duchin Plans Disagree on Partisan Lean of Districts**

6.1 Davidson House County Grouping

Davidson County contains 2 districts. In the Enacted Map these are Districts 80 and 81. The county cluster has an overall partisan index of 0.27, which is strongly Republican. After conducting 50,000 initial simulations to create two districts in this cluster, I would normally discard any simulations that contain more county traversals than the Enacted Plan. However, in this case the county cluster is only one county (Davidson) and so the simulations are constrained to keep both districts entirely within the county, and thus, by definition there will be no county traversals in all 50,000 simulations as well as in the Enacted Map. Next, I discard any simulations in which the average compactness score of the districts in the simulations is not as large or larger than the compactness score of the Enacted Map. This leaves 37,252 simulated maps, each containing two districts.

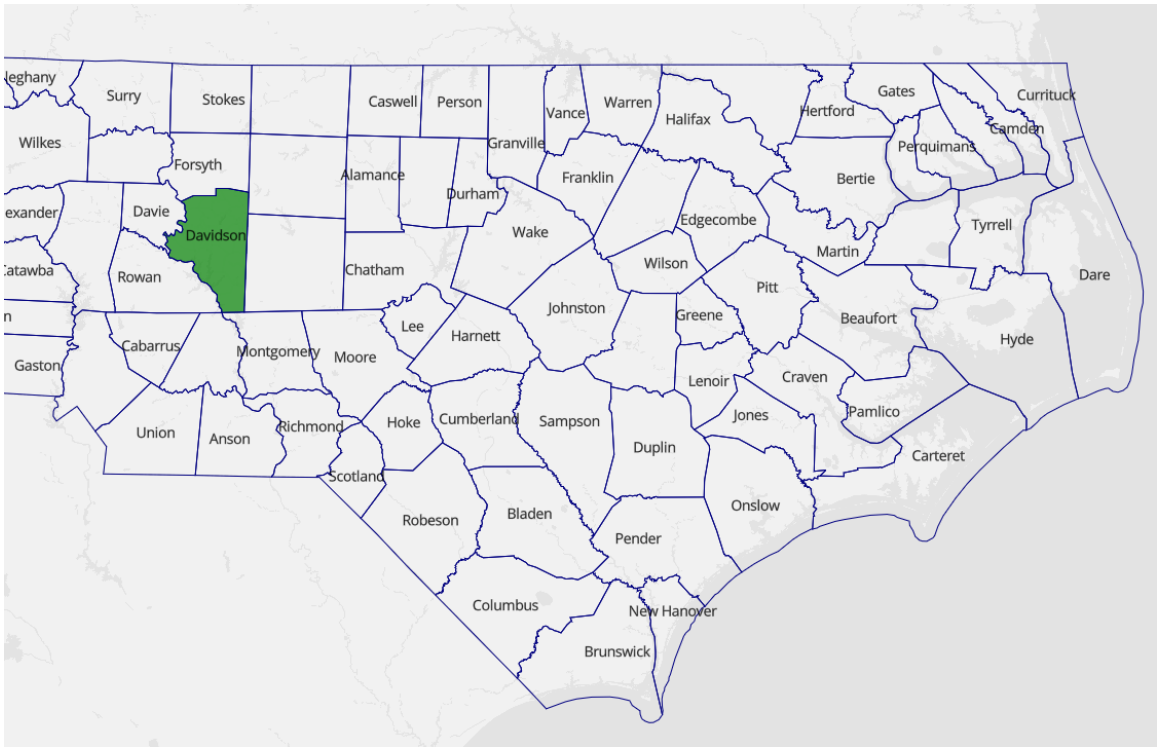
A map of the location of this county cluster in relation to the rest of the state is shown in Figure 9. A map of the Enacted Plan's districts within this cluster is shown in Figure 10.

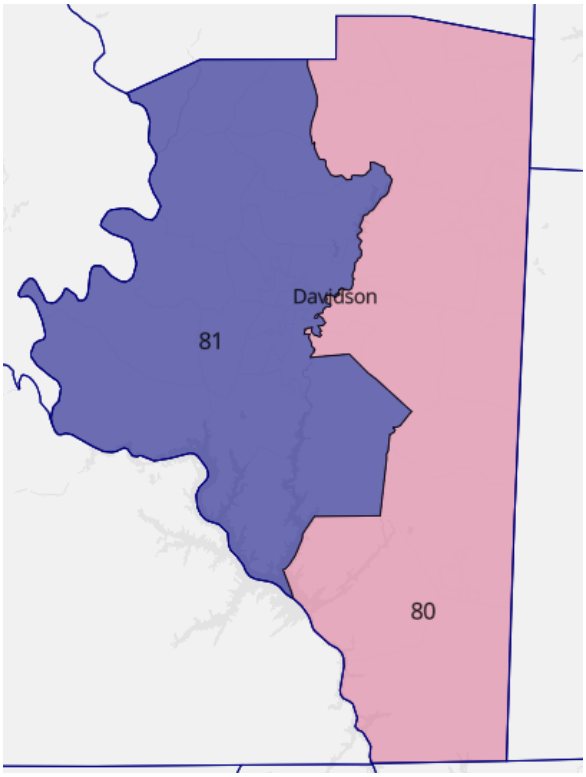
The distribution of likely district partisanship based on the statewide partisan elections index calculated for each of the simulation results is shown in Figure 11. The black bars show the distribution from the simulation results, with the percentage of simulations that generate each of the various possible number of Democratic seats in the cluster shown below each bar. The red vertical line shows the number of Democratic leaning seats in the Enacted Map in the same cluster, and the vertical dashed green line shows the number of Democratic leaning seats in the Duchin Map in the cluster. In this cluster the simulations, the Enacted Map, and the Duchin Map are in agreement, and all generate 0 Democratic leaning districts.

Table 3 breaks apart the partisan index into the 11 constituent elections and shows the distribution of Democratic leaning seats generated if one were to look at each election separately. Each row shows the percent of simulations that produce the number of Democratic leaning districts using the election or election index indicated in the row. The bolded

number in each row is the number of Democratic leaning districts produced by the Enacted Plan using the equivalent election. In this case there is unanimous agreement across all 11 elections.

Figure 9: **Map of Davidson House County Cluster**





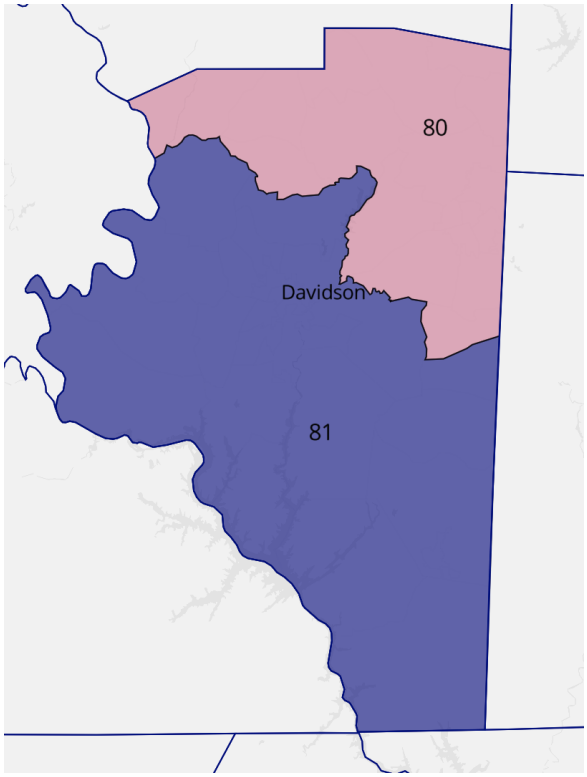


Figure 10: **Map of House Enacted Plan in Davidson County Cluster**

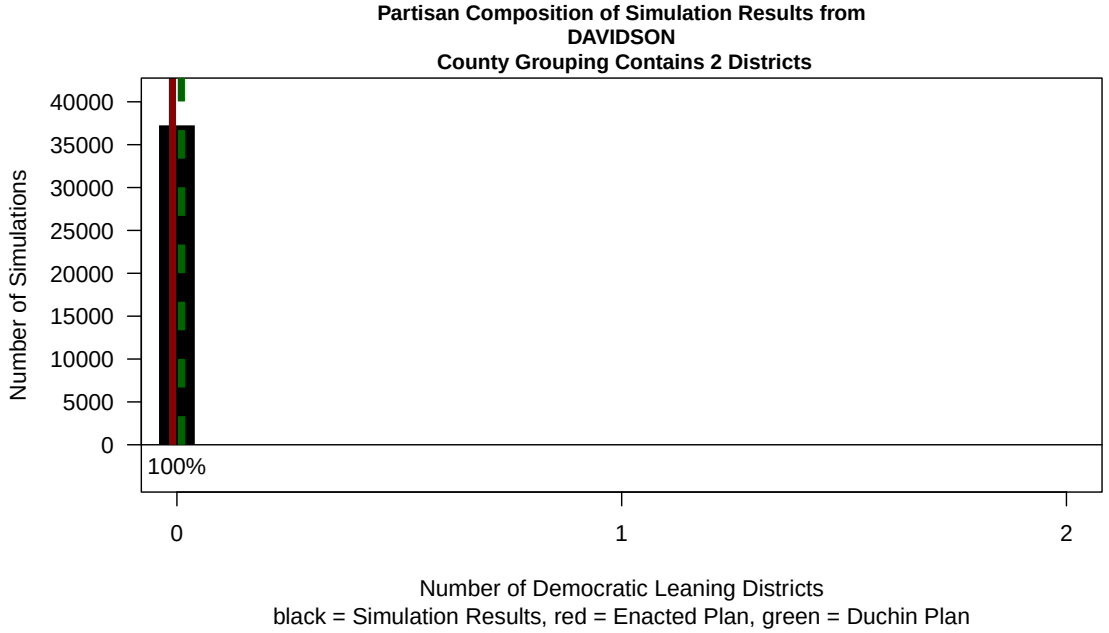
(b) Duchin Map



Note: The left map shows the district lines for the Enacted Map and the right map shows the district lines for the Duchin Map.

Partisan Lean of Districts

District:	Enacted Plan	Duchin Plan
80	0.26	0.28
81	0.29	0.27

Note: Partisan index is based on the two-party vote average of 11 statewide partisan elections between 2014-2020.

Figure 11: **Distribution of Partisan Districts from Simulations in Davidson House County Cluster**

Note: Distribution of likely district partisanship based on the statewide partisan elections index calculated for each of the simulation results. The black bars show the distribution from the simulation results, with the percentage of simulations that generate each of the various possible number of Democratic seats in the cluster shown below each bar. The red vertical line shows the number of Democratic leaning seats in the Enacted Map in the same cluster, and the vertical dashed green line shows the number of Democratic leaning seats in the Duchin Map in the cluster.

Table 3: Simulation Results by Individual Elections

Davidson House County Cluster

Number of Democratic Leaning Districts:			
	0	1	2
Individual Elections:			
2020 President	**100%**	0%	0%
2020 Senate	**100%**	0%	0%
2020 Governor	**100%**	0%	0%
2020 Lt. Governor	**100%**	0%	0%
2020 Attorney General	**100%**	0%	0%
2016 President	**100%**	0%	0%
2016 Senate	**100%**	0%	0%
2016 Governor	**100%**	0%	0%
2016 Lt. Governor	**100%**	0%	0%
2016 Attorney General	**100%**	0%	0%
2014 Senate	**100%**	0%	0%

Note: Each row shows the percent of simulations that produce the number of Democratic leaning districts using the election or election index indicated in the row. The bolded number in each row is the number of Democratic leaning districts produced by the Enacted Plan using the equivalent election. For example, using the 2020 Presidential election 100% of the simulations produce 0 Democratic leaning districts. The Enacted Plan does as well, as the '0 District' cell is bolded in that row.

6.2 Pitt House County Grouping

Pitt County contains 2 districts. In the Enacted Map these are Districts 8 and 9. The county cluster has an overall partisan index of 0.54, which is slightly Democratic. After conducting 50,000 initial simulations to create two districts in this cluster, I would normally discard any simulations that contain more county traversals than the Enacted Plan. However, in this case the county cluster is only one county and so the simulations are constrained to keep both districts entirely within the county, and thus, by definition there will be no county traversals in all 50,000 simulations as well as in the Enacted Map. Next, I discard any simulations in which the average compactness score of the districts in the simulations is not as large or larger than the compactness score of the Enacted Map. This leaves 5,189 simulated maps, each containing two districts.

A map of the location of this county cluster in relation to the rest of the state is shown in Figure 12. A map of the Enacted Maps' districts and the Duchin Map's district boundaries within this cluster are shown in Figure 13.

The distribution of district partisanship based on the statewide partisan elections index calculated for each of the simulation results is shown in Figure 14. The black bars show the distribution from the simulation results, with the percentage of simulations that generate each of the various possible number of Democratic seats in the cluster shown below each bar. The red vertical line shows the number of Democratic leaning seats in the Enacted Map in the same cluster, and the vertical dashed green line shows the number of Democratic leaning seats in the Duchin Map in the cluster. In 91% of the simulations there is 1 Democratic leaning district and in the remaining 9% of the simulations there are two Democratic leaning districts. The Enacted Map is in alignment with the modal outcome of the simulations by creating one Democratic district. The Duchin Map generates two Democratic districts.

Table 4 breaks apart the partisan index into the 11 constituent elections and shows the distribution of Democratic leaning seats generated if one were to look at each election separately. Each row shows the percent of simulations that produce the number of Demo-

cratic leaning districts using the election or election index indicated in the row. The bolded number in each row is the number of Democratic leaning districts produced by the Enacted Plan using the equivalent election. In this case there is unanimous agreement between the modal outcome in the simulations and the Enacted Map across all 11 elections.

Partisan Lean of Districts

District:	Enacted Plan	Duchin Plan
8	0.64	0.55
9	0.46	0.53

Note: Partisan index is based on the two-party vote average of 11 statewide partisan elections between 2014-2020.

Figure 14: **Distribution of Partisan Districts from Simulations in Pitt House County Cluster**

Note: Distribution of likely district partisanship based on the statewide partisan elections index calculated for each of the simulation results. The black bars show the distribution from the simulation results, with the percentage of simulations that generate each of the various possible number of Democratic seats in the cluster shown below each bar. The red vertical line shows the number of Democratic leaning seats in the Enacted Map in the same cluster, and the vertical dashed green line shows the number of Democratic leaning seats in the Duchin Map in the cluster.

Table 4: Simulation Results by Individual Elections

Pitt House County Cluster

Number of Democratic Leaning Districts:			
	0	1	2
Individual Elections:			
2020 President	0%	**89%**	11%
2020 Senate	0%	**91%**	9%
2020 Governor	0%	**44%**	56%
2020 Lt. Governor	0%	**94%**	6%
2020 Attorney General	0%	**71%**	29%
2016 President	0%	**97%**	3%
2016 Senate	0%	**100%**	0%
2016 Governor	0%	**97%**	3%
2016 Lt. Governor	0%	**100%**	0%
2016 Attorney General	0%	**83%**	17%
2014 Senate	0%	**100%**	0%

Note: Each row shows the percent of simulations that produce the number of Democratic leaning districts using the election or election index indicated in the row. The bolded number in each row is the number of Democratic leaning districts produced by the Enacted Plan using the equivalent election. For example, using the 2020 Presidential election 89% of the simulations produce 1 Democratic leaning district. The Enacted Plan does as well, as the '1 District' cell is bolded in that row.

6.3 Alamance House County Grouping

Alamance County contains 2 districts. In the Enacted Map these are Districts 63 and 64. The county cluster has an overall partisan index of 0.45, which is slightly Republican. After conducting 50,000 initial simulations to create two districts in this cluster, I would normally discard any simulations that contain more county traversals than the Enacted Plan. However, in this case the county cluster is only one county and so the simulations are constrained to keep both districts entirely within the county, and thus, by definition there will be no county traversals in all 50,000 simulations as well as in the Enacted Map. Next, I discard any simulations in which the average compactness score of the districts in the simulations is not as large or larger than the compactness score of the Enacted Map. This leaves 47,482 simulated maps, each containing two districts.

A map of the location of this county cluster in relation to the rest of the state is shown in Figure 15. A map of the Enacted Maps' districts and the Duchin Map's district boundaries within this cluster are shown in Figure 16. I also include the map of districts in this county from the 2020 plan for comparison here.

The distribution of district partisanship based on the statewide partisan elections index calculated for each of the simulation results is shown in Figure 17. The black bars show the distribution from the simulation results, with the percentage of simulations that generate each of the various possible number of Democratic seats in the cluster shown below each bar. The red vertical line shows the number of Democratic leaning seats in the Enacted Map in the same cluster, and the vertical dashed green line shows the number of Democratic leaning seats in the Duchin Map in the cluster. In 44% of the simulations there are 0 Democratic leaning districts and in the remaining 56% of the simulations there is 1 Democratic leaning district. The Enacted Map is within the middle 50% if the simulation results, but is not in alignment with the modal outcome of the simulations. The Duchin Map generates 1 Democratic district.

Table 5 breaks apart the partisan index into the 11 constituent elections and shows

the distribution of Democratic leaning seats generated if one were to look at each election separately. Each row shows the percent of simulations that produce the number of Democratic leaning districts using the election or election index indicated in the row. The bolded number in each row is the number of Democratic leaning districts produced by the Enacted Plan using the equivalent election. In 10 of the 11 elections considered the Enacted Plan agrees with the modal outcome of the simulations. The only case in which it does not agree with the modal result is in the 2020 Lt. Governor's race. However, in this race the simulations were nearly equally split between generating 0 and 1 Democratic district.

The Enacted Plan is also extremely similar to the maps used in Alamance County in the 2020 elections. These districts were approved by a court in 2019. The Enacted Plan is different by only two and one half precincts - South Burlington precinct is now placed in District 64 (it was in District 63 in the 2020 map) and North Thompson and the part of Melville 3 precinct that was split into District 64 is now placed into District 63, making it whole and keeping the municipality of Swepsonville entirely in District 63.

Another consideration is that while the Enacted Plan does not generate a Democratic leaning district using the partisan index, there is one district that is effectively a 50/50 split between Republicans and Democrats. The partisan index of District 63 is 0.4994, which is about as close to a perfect split between Republican and Democratic votes as a district could get. It is very likely that both parties will win this district a number of times over the next several years.

Figure 15: **Map of Alamance House County Cluster**

Partisan Lean of Districts

District:	Enacted Plan	Duchin Plan
63	0.50	0.54
64	0.41	0.38

Note: Partisan index is based on the two-party vote average of 11 statewide partisan elections between 2014-2020.

Figure 17: **Distribution of Partisan Districts from Simulations in Alamance House County Cluster**

Note: Distribution of likely district partisanship based on the statewide partisan elections index calculated for each of the simulation results. The black bars show the distribution from the simulation results, with the percentage of simulations that generate each of the various possible number of Democratic seats in the cluster shown below each bar. The red vertical line shows the number of Democratic leaning seats in the Enacted Map in the same cluster, and the vertical dashed green line shows the number of Democratic leaning seats in the Duchin Map in the cluster.

Table 5: Simulation Results by Individual Elections

Alamance House County Cluster

Number of Democratic Leaning Districts:			
	0	1	2
Individual Elections:			
2020 President	40%	**60%**	0%
2020 Senate	38%	**62%**	0%
2020 Governor	3%	**97%**	0%
2020 Lt. Governor	**47%**	53%	0%
2020 Attorney General	13%	**87%**	0%
2016 President	**77%**	23%	0%
2016 Senate	**98%**	2%	0%
2016 Governor	39%	**61%**	0%
2016 Lt. Governor	**99%**	1%	0%
2016 Attorney General	42%	**58%**	0%
2014 Senate	**97%**	3%	0%

Note: Each row shows the percent of simulations that produce the number of Democratic leaning districts using the election or election index indicated in the row. The bolded number in each row is the number of Democratic leaning districts produced by the Enacted Plan using the equivalent election. For example, using the 2020 Presidential election 60% of the simulations produce 1 Democratic leaning district. The Enacted Plan does as well, as the '1 District' cell is bolded in that row.

6.4 Columbus and Robeson House County Grouping

The Columbus-Robeson House county grouping contains 2 districts. In the Enacted Map these are Districts 46 and 47. The county cluster has an overall partisan index of 0.45, which is slightly Republican. After conducting 50,000 initial simulations to create two districts in this cluster, I discard any simulations that contain more county traversals than the Enacted Plan. This leaves 46,076 remaining simulated maps. Next, I discard any simulations in which the average compactness score of the districts in the simulations is not as large or larger than the compactness score of the Enacted Map. This leaves 2,664 simulated maps, each containing two districts.

A map of the location of this county cluster in relation to the rest of the state is shown in Figure 18. A map of the Enacted Map's district boundaries and the Duchin Map's district boundaries within this county grouping are shown in Figure 19.

The distribution of district partisanship based on the statewide partisan elections index calculated for each of the simulation results is shown in Figure 20. The black bars show the distribution from the simulation results, with the percentage of simulations that generate each of the various possible number of Democratic seats in the cluster shown below each bar. The red vertical line shows the number of Democratic leaning seats in the Enacted Map in the same cluster, and the vertical dashed green line shows the number of Democratic leaning seats in the Duchin Map in the cluster. In 100% of the simulations there are 0 Democratic leaning districts. The Enacted Map is in alignment with the modal outcome of the simulations by creating 0 Democratic districts. The Duchin Map also generates 0 Democratic district.

Table 6 breaks apart the partisan index into the 11 constituent elections and shows the distribution of Democratic leaning seats generated if one were to look at each election separately. Each row shows the percent of simulations that produce the number of Democratic leaning districts using the election or election index indicated in the row. The bolded number in each row is the number of Democratic leaning districts produced by the Enacted

Plan using the equivalent election. In this case there is unanimous agreement between the modal outcome in the simulations and the Enacted Map across all 11 elections.

Note: Distribution of likely district partisanship based on the statewide partisan elections index calculated for each of the simulation results. The black bars show the distribution from the simulation results, with the percentage of simulations that generate each of the various possible number of Democratic seats in the cluster shown below each bar. The red vertical line shows the number of Democratic leaning seats in the Enacted Map in the same cluster, and the vertical dashed green line shows the number of Democratic leaning seats in the Duchin Map in the cluster.

Table 6: Simulation Results by Individual Elections

Columbus and Robeson House County Cluster

Number of Democratic Leaning Districts:			
	0	1	2
Individual Elections:			
2020 President	**100%**	0%	0%
2020 Senate	**100%**	0%	0%
2020 Governor	**100%**	0%	0%
2020 Lt. Governor	**100%**	0%	0%
2020 Attorney General	**100%**	0%	0%
2016 President	**100%**	0%	0%
2016 Senate	**100%**	0%	0%
2016 Governor	**100%**	0%	0%
2016 Lt. Governor	0%	**100%**	0%
2016 Attorney General	0%	**53%**	47%
2014 Senate	0	0%	**100%**

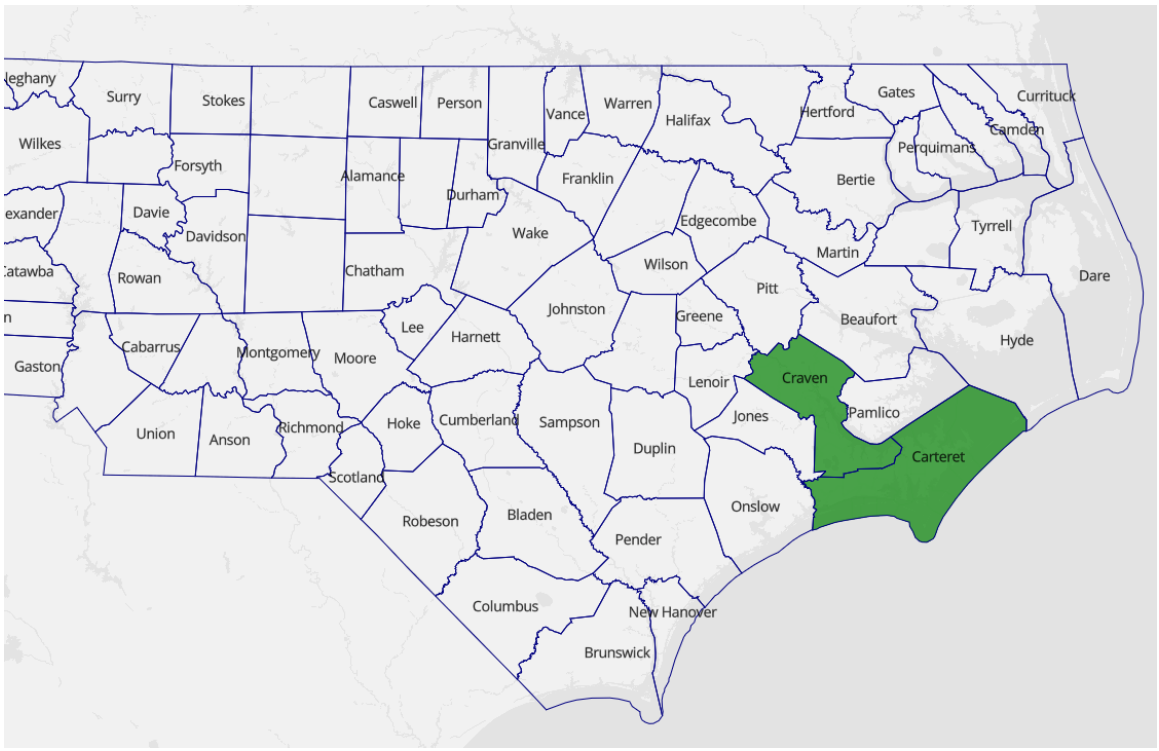
Note: Each row shows the percent of simulations that produce the number of Democratic leaning districts using the election or election index indicated in the row. The bolded number in each row is the number of Democratic leaning districts produced by the Enacted Plan using the equivalent election. For example, using the 2020 Presidential election 100% of the simulations produce 0 Democratic leaning districts. The Enacted Plan does as well, as the '0 District' cell is bolded in that row.

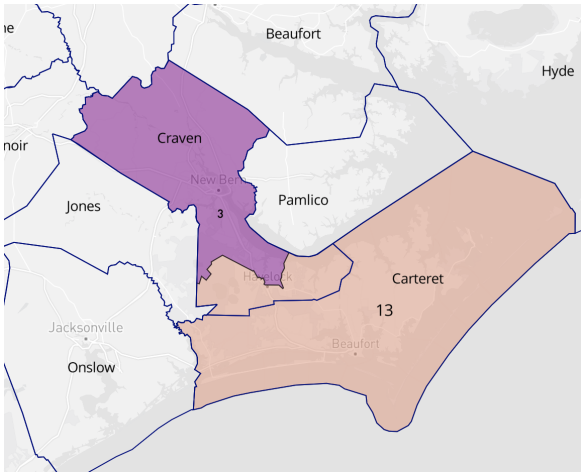
6.5 Carteret and Craven House County Grouping

The Carteret-Craven House county grouping contains 2 districts. In the Enacted Map these are Districts 3 and 13. The county cluster has an overall partisan index of 0.35, which is strongly Republican. I do not conduct simulations in this cluster because there is no possible way to assemble VTDs in this county grouping and produce two districts that meet the equal population criteria. To do so requires splitting a VTD, something both the Enacted Plan and Duchin Plans do, but the simulations are not capable of. However, there is agreement between the Enacted Plan and the Duchin Plan, as both plans create two Republican leaning districts that are nearly identical in shape. Furthermore, given the strong Republican lean of the county grouping and relatively even distribution of partisan preferences in the county, it would be impossible to assemble any district that leans Democratic.

A map of the location of this county cluster in relation to the rest of the state is shown in Figure 21. A map of the Enacted Map's district boundaries and the Duchin Map's district boundaries within this county grouping are shown in Figure 22.

Figure 21: **Map of Carteret and Craven County Cluster**





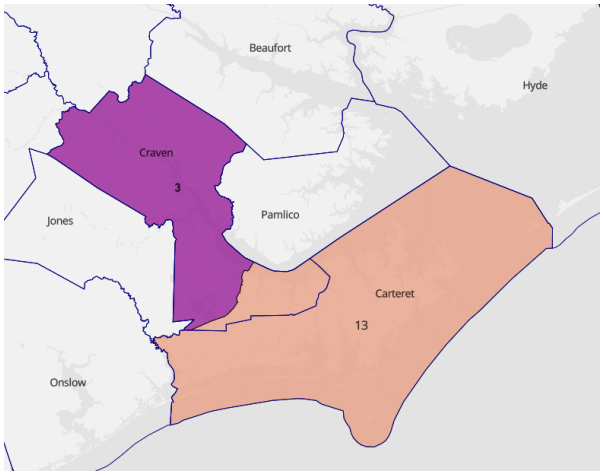


Figure 22: **Map of House Enacted Plan in Carteret and Craven County Cluster**

(a) Enacted Map

(b) Duchin Map

Partisan Lean of Districts

District:	Enacted Plan	Duchin Plan
3	0.40	0.40
13	0.31	0.31

Note: Partisan index is based on the two-party vote average of 11 statewide partisan elections between 2014-2020.

6.6 Duplin and Wayne House County Grouping

The Duplin-Wayne House county grouping contains 2 districts. In the Enacted Map these are Districts 4 and 10. The county cluster has an overall partisan index of 0.43, which is moderately Republican. After conducting 50,000 initial simulations to create two districts in this cluster, I discard any maps that contain more county traversals than the Enacted Plan, leaving 23,399 maps. Next, I would normally discard any simulations in which the average compactness score of the districts in the simulations that are not as large or larger than the compactness score of the Enacted Map. However, this leaves 0 simulated maps, as the Enacted Plan is more compact than any of the simulations (an average Polsby-Popper score of .50, which is very high). To have some simulations to compare to the Enacted Plan and the Duchin plan, I retained the 10% of the simulated maps that have the highest compactness score (2,704 maps).

A map of the location of this county cluster in relation to the rest of the state is shown in Figure 23. A map of the Enacted Maps' districts and the Duchin Map's district boundaries within this cluster are shown in Figure 24.

The distribution of district partisanship based on the statewide partisan elections index calculated for each of the simulation results is shown in Figure 25. The black bars show the distribution from the simulation results, with the percentage of simulations that generate each of the various possible number of Democratic seats in the cluster shown below each bar. The red vertical line shows the number of Democratic leaning seats in the Enacted Map in the same cluster, and the vertical dashed green line shows the number of Democratic leaning seats in the Duchin Map in the cluster. In 100% of the simulations there are 0 Democratic leaning districts. The Enacted Map is in agreement with the simulation results and generates 0 Democratic leaning districts. The Duchin Map creates one Democratic leaning district (District 21) surrounding the town of Goldsboro. However to avoid Republican leaning VTDs in the north and western portions of Wayne County, District 4 in the Duchin Plan joins these VTDs with Duplin County to the south. This creates a district that has a

northern "hook," which is much less compact than the districts in the Enacted Plan. The average Polsby-Popper score for Districts 21 and 4 in the Duchin plan is 0.32. What reason could there be for the shape of District 4? One possibility is that the district is attempting to keep Goldsboro, the largest city in Wayne County whole. However, both the Enacted and Duchin plans keep Goldsboro whole.[25] Given this, it is hard to imagine another explanation for the unusual shape of District 4 aside from an attempt to avoid Republican precincts so as to create a Democratic leaning seat in District 21.

Table 7 breaks apart the partisan index into the 11 constituent elections and shows the distribution of Democratic leaning seats generated if one were to look at each election separately. Each row shows the percent of simulations that produce the number of Democratic leaning districts using the election or election index indicated in the row. The bolded number in each row is the number of Democratic leaning districts produced by the Enacted Plan using the equivalent election. In all 11 of the elections considered the Enacted Plan agrees with the modal (most common) outcome of the simulations.

[25]The Enacted Plan places 5 residents from Goldsboro and the Goldsboro wastewater treatment plant in District 4. The remaining 99.99% of Goldsboro is in District 10.

4	0.41	0.36
10 (21 in Duchin)	0.46	0.51

Note: Partisan index is based on the two-party vote average of 11 statewide partisan elections between 2014-2020.

Figure 25: **Distribution of Partisan Districts from Simulations in Duplin and Wayne House County Cluster**

Note: Distribution of likely district partisanship based on the statewide partisan elections index calculated for each of the simulation results. The black bars show the distribution from the simulation results, with the percentage of simulations that generate each of the various possible number of Democratic seats in the cluster shown below each bar. The red vertical line shows the number of Democratic leaning seats in the Enacted Map in the same cluster, and the vertical dashed green line shows the number of Democratic leaning seats in the Duchin Map in the cluster.

Table 7: Simulation Results by Individual Elections

Duplin and Wayne House County Cluster

Number of Democratic Leaning Districts:			
	0	1	2
Individual Elections:			
2020 President	**100%**	0%	0%
2020 Senate	**100%**	0%	0%
2020 Governor	**100%**	0%	0%
2020 Lt. Governor	**100%**	0%	0%
2020 Attorney General	**100%**	0%	0%
2016 President	**100%**	0%	0%
2016 Senate	**100%**	0%	0%
2016 Governor	**100%**	0%	0%
2016 Lt. Governor	**100%**	0%	0%
2016 Attorney General	**95%**	5%	0%
2014 Senate	**95%**	5%	0%

Note: Each row shows the percent of simulations that produce the number of Democratic leaning districts using the election or election index indicated in the row. The bolded number in each row is the number of Democratic leaning districts produced by the Enacted Plan using the equivalent election. For example, using the 2020 Presidential election 100% of the simulations produce 0 Democratic leaning districts. The Enacted Plan does as well, as the '0 District' cell is bolded in that row.

6.7 Nash and Wilson House County Grouping

The Nash-Wilson House county grouping contains 2 districts. In the Enacted Map these are Districts 24 and 25. The county cluster has an overall partisan index of 0.52, which is slightly Democratic. After conducting 50,000 initial simulations to create two districts in this cluster, I discard any simulations that contain more county traversals than the Enacted Plan. This leaves 41,476 remaining simulated maps. Next, I discard any simulations in which the average compactness score of the districts in the simulations is not as large or larger than the compactness score of the Enacted Map. This leaves 14,569 simulated maps, each containing two districts.

A map of the location of this county cluster in relation to the rest of the state is shown in Figure 26. A map of the Enacted Map's district boundaries and the Duchin Map's district boundaries within this county grouping are shown in Figure 27.

The distribution of district partisanship based on the statewide partisan elections index calculated for each of the simulation results is shown in Figure 28. The black bars show the distribution from the simulation results, with the percentage of simulations that generate each of the various possible number of Democratic seats in the cluster shown below each bar. The red vertical line shows the number of Democratic leaning seats in the Enacted Map in the same cluster, and the vertical dashed green line shows the number of Democratic leaning seats in the Duchin Map in the cluster. In 100% of the simulations there are 2 Democratic leaning districts. The Enacted Map is in alignment with the modal outcome of the simulations by also creating 2 Democratic districts. The Duchin Map also generates 2 Democratic districts.

Table 8 breaks apart the partisan index into the 11 constituent elections and shows the distribution of Democratic leaning seats generated if one were to look at each election separately. Each row shows the percent of simulations that produce the number of Democratic leaning districts using the election or election index indicated in the row. The bolded number in each row is the number of Democratic leaning districts produced by the Enacted

Plan using the equivalent election. In this case there is unanimous agreement between the modal outcome in the simulations and the Enacted Map across all 11 elections.

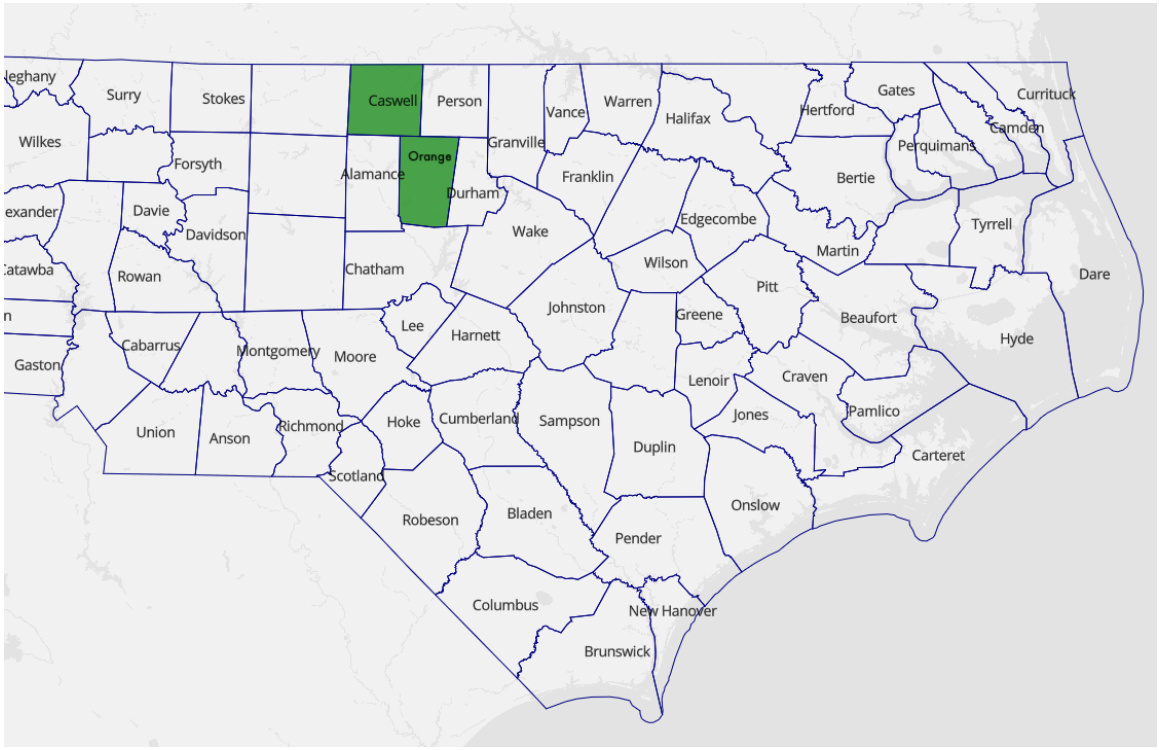
2016 Lt. Governor	0%	0%	**100%**
2016 Attorney General	0%	0%	**100%**
2014 Senate	0%	**88%**	12%

Note: Each row shows the percent of simulations that produce the number of Democratic leaning districts using the election or election index indicated in the row. The bolded number in each row is the number of Democratic leaning districts produced by the Enacted Plan using the equivalent election. For example, using the 2020 Presidential election 88% of the simulations produce 1 Democratic leaning districts. The Enacted Plan does as well, as the '1 District' cell is bolded in that row.

6.8 Caswell and Orange House County Grouping

The Caswell-Orange House county grouping contains 2 districts. In the Enacted Map these are Districts 50 and 56. The county cluster has an overall partisan index of 0.71, which is strongly Democratic. After conducting 50,000 initial simulations to create two districts in this cluster, I discard any simulations that contain more county traversals than the Enacted Plan. This leaves 50,000 simulated maps since in this case all of the simulation results only include one county traversal, as does the Enacted Map. Next, I discard any simulations in which the average compactness score of the districts in the simulations is not as large or larger than the compactness score of the Enacted Map. This leaves 40,012 simulated maps, each containing two districts.



A map of the location of this county cluster in relation to the rest of the state is shown in Figure 29. A map of the Enacted Map's district boundaries and the Duchin Map's district boundaries within this county grouping are shown in Figure 30.

The distribution of district partisanship based on the statewide partisan elections index calculated for each of the simulation results is shown in Figure 31. The black bars show the distribution from the simulation results, with the percentage of simulations that generate each of the various possible number of Democratic seats in the cluster shown below each bar. The red vertical line shows the number of Democratic leaning seats in the Enacted Map in the same cluster, and the vertical dashed green line shows the number of Democratic leaning seats in the Duchin Map in the cluster. In 100% of the simulations there are 2 Democratic leaning districts. The Enacted Map is in alignment with the modal outcome of the simulations by also creating 2 Democratic districts. The Duchin Map also generates 2 Democratic districts.

Table 9 breaks apart the partisan index into the 11 constituent elections and shows the distribution of Democratic leaning seats generated if one were to look at each election separately. Each row shows the percent of simulations that produce the number of Democratic leaning districts using the election or election index indicated in the row. The bolded

number in each row is the number of Democratic leaning districts produced by the Enacted Plan using the equivalent election. In this case there is unanimous agreement between the modal outcome in the simulations and the Enacted Map across all 11 elections.

2016 Attorney General	0%	0%	**100%**
2014 Senate	0%	0%	**100%**

Note: Each row shows the percent of simulations that produce the number of Democratic leaning districts using the election or election index indicated in the row. The bolded number in each row is the number of Democratic leaning districts produced by the Enacted Plan using the equivalent election. For example, using the 2020 Presidential election 100% of the simulations produce 2 Democratic leaning districts. The Enacted Plan does as well, as the '2 District' cell is bolded in that row.

6.9 Alexander, Surry, and Wilkes House County Grouping

The Alexander-Surry-Wilkes House county grouping contains 2 districts. In the Enacted Map these are Districts 90 and 94. The county cluster has an overall partisan index of 0.25, which is strongly Republican. After conducting 50,000 initial simulations to create two districts in this cluster, I discard any simulations that contain more county traversals than the Enacted Plan. This leaves 49,931 simulated maps. Next, I discard any simulations in which the average compactness score of the districts in the simulations is not as large or larger than the compactness score of the Enacted Map. This leaves 20,124 simulated maps, each containing two districts.

A map of the location of this county cluster in relation to the rest of the state is shown in Figure 32. A map of the Enacted Map's district boundaries and the Duchin Map's district boundaries within this county grouping are shown in Figure 33.

The distribution of district partisanship based on the statewide partisan elections index calculated for each of the simulation results is shown in Figure 34. The black bars show the distribution from the simulation results, with the percentage of simulations that generate each of the various possible number of Democratic seats in the cluster shown below each bar. The red vertical line shows the number of Democratic leaning seats in the Enacted Map in the same cluster, and the vertical dashed green line shows the number of Democratic leaning seats in the Duchin Map in the cluster. In 100% of the simulations there are 0 Democratic leaning districts. The Enacted Map is in alignment with the modal outcome of the simulations by also creating 0 Democratic districts. The Duchin Map also generates 0 Democratic districts.

Table 10 breaks apart the partisan index into the 11 constituent elections and shows the distribution of Democratic leaning seats generated if one were to look at each election separately. Each row shows the percent of simulations that produce the number of Democratic leaning districts using the election or election index indicated in the row. The bolded number in each row is the number of Democratic leaning districts produced by the Enacted

Plan using the equivalent election. In this case there is unanimous agreement between the modal outcome in the simulations and the Enacted Map across all 11 elections.

6.10 Franklin, Granville, and Vance House County Grouping

The Franklin-Granville-Vance House county grouping contains 2 districts. In the Enacted Map these are Districts 32 and 7. The county cluster has an overall partisan index of 0.51, which is very slightly Democratic. After conducting 50,000 initial simulations to create two districts in this cluster, I discard any simulations that contain more county traversals than the Enacted Plan. This leaves 17,823 simulated maps. Next, I discard any simulations in which the average compactness score of the districts in the simulations is not as large or larger than the compactness score of the Enacted Map. This leaves 7,682 simulated maps, each containing two districts.

A map of the location of this county cluster in relation to the rest of the state is shown in Figure 35. A map of the Enacted Map's district boundaries and the Duchin Map's district boundaries within this county grouping are shown in Figure 36.

The distribution of district partisanship based on the statewide partisan elections index calculated for each of the simulation results is shown in Figure 37. The black bars show the distribution from the simulation results, with the percentage of simulations that generate each of the various possible number of Democratic seats in the cluster shown below each bar. The red vertical line shows the number of Democratic leaning seats in the Enacted Map in the same cluster, and the vertical dashed green line shows the number of Democratic leaning seats in the Duchin Map in the cluster. In 100% of the simulations there is 1 Democratic leaning district. The Enacted Map is in alignment with the modal outcome of the simulations by also creating 1 Democratic district. The Duchin Map also generates 1 Democratic district.

Table 11 breaks apart the partisan index into the 11 constituent elections and shows the distribution of Democratic leaning seats generated if one were to look at each election separately. Each row shows the percent of simulations that produce the number of Democratic leaning districts using the election or election index indicated in the row. The bolded number in each row is the number of Democratic leaning districts produced by the Enacted

Plan using the equivalent election. In this case there is unanimous agreement between the modal outcome in the simulations and the Enacted Map across all 11 elections.

Table 11: Simulation Results by Individual Elections

Franklin, Granville, and Vance House County Cluster

Number of Democratic Leaning Districts:			
	0	1	2
Individual Elections:			
2020 President	0%	**100%**	0%
2020 Senate	0%	**100%**	0%
2020 Governor	0%	**100%**	0%
2020 Lt. Governor	0%	**100%**	0%
2020 Attorney General	0%	**100%**	0%
2016 President	0%	**100%**	0%
2016 Senate	0%	**100%**	0%
2016 Governor	0%	**100%**	0%
2016 Lt. Governor	0%	**100%**	0%
2016 Attorney General	0%	**100%**	0%
2014 Senate	0%	**100%**	0%

Note: Each row shows the percent of simulations that produce the number of Democratic leaning districts using the election or election index indicated in the row. The bolded number in each row is the number of Democratic leaning districts produced by the Enacted Plan using the equivalent election. For example, using the 2020 Presidential election 100% of the simulations produce 1 Democratic leaning district. The Enacted Plan does as well, as the '1 District' cell is bolded in that row.

6.11 Alleghany, Ashe, Caldwell, and Watauga House County Grouping

The Alleghany-Ashe-Caldwell-Watauga House county grouping contains 2 districts. In the Enacted Map these are Districts 93 and 87. The county cluster has an overall partisan index of 0.36, which is strongly Republican. After conducting 50,000 initial simulations to create two districts in this cluster, I discard any simulations that contain more county traversals than the Enacted Plan. This leaves 47,843 simulated maps. Next, I discard any simulations in which the average compactness score of the districts in the simulations is not as large or larger than the compactness score of the Enacted Map. This leaves only six unique maps that are as compact as the Enacted Plan.

A map of the location of this county cluster in relation to the rest of the state is shown in Figure 38. A map of the Enacted Map's district boundaries and the Duchin Map's district boundaries within this county grouping are shown in Figure 39.

Because there are only six maps that fit the criteria I use of equal population, county traversals, and compactness equal to or better than the Enacted Map, I do not present the distribution of district partisanship for the simulations here. It is sufficient to say that in the Enacted Map, the Duchin map, and the six remaining simulations, all create 2 Republican districts and 0 Democratic leaning districts, regardless of the index or election used. Table 12 shows this below.

2016 Attorney General	**100%**	0%	0%
2014 Senate	**100%**	0%	0%

Note: Each row shows the percent of simulations that produce the number of Democratic leaning districts using the election or election index indicated in the row. The bolded number in each row is the number of Democratic leaning districts produced by the Enacted Plan using the equivalent election. For example, using the 2020 Presidential election 100% of the simulations produce 0 Democratic leaning districts. The Enacted Plan does as well, as the '0 District' cell is bolded in that row.

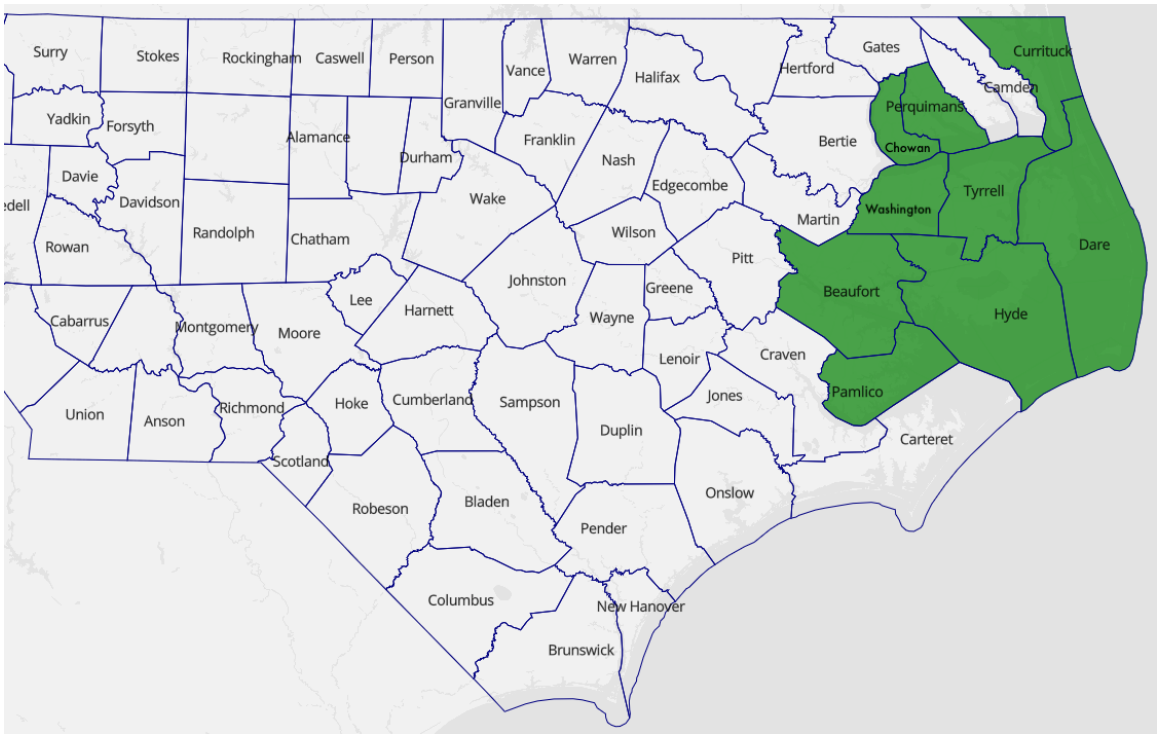
6.12 Beaufort, Chowan, Currituck, Dare, Hyde, Pamlico, Perquimans, Tyrrell, and Washington House County Grouping

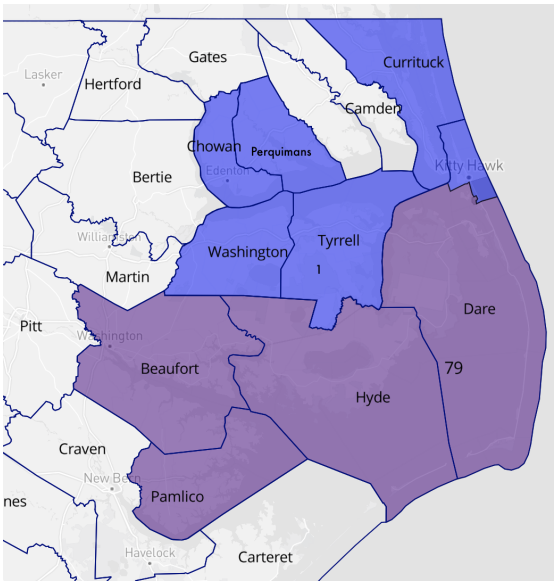
The Beaufort-Chowan-Currituck-Dare-Hyde-Pamlico-Perquimans-Tyrrell-Washington House county grouping contains 2 districts. In the Enacted Map these are Districts 1 and 79. The county cluster has an overall partisan index of 0.39, which is strongly Republican. After conducting 50,000 initial simulations to create two districts in this cluster, I discard any simulations that contain more county traversals than the Enacted Plan. This leaves 379 simulated maps. Next, I discard any simulations in which the average compactness score of the districts in the simulations is not as large or larger than the compactness score of the Enacted Map. This leaves only two unique maps that are as compact as the Enacted Plan.

A map of the location of this county cluster in relation to the rest of the state is shown in Figure 40. A map of the Enacted Map's district boundaries and the Duchin Map's district boundaries within this county grouping are shown in Figure 41.

Because there are only two maps that fit the criteria I use of equal population, county traversals, and compactness equal to or better than the Enacted Map, I do not present the distribution of district partisanship for the simulations here. It is sufficient to say that in the Enacted Map, the Duchin map, and the two remaining simulations, all create 2 Republican districts and 0 Democratic leaning districts, regardless of the index or election used. Table 13 shows this below.

Figure 40: **Map of Beaufort, Chowan, Currituck, Dare, Hyde, Pamlico, Perquimans, Tyrrell, and Washington House County Cluster**





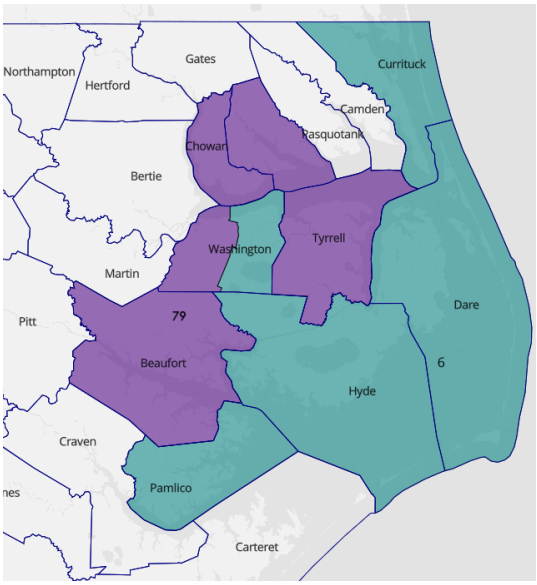


Figure 41: **Map of House Enacted Plan in Beaufort, Chowan, Currituck, Dare, Hyde, Pamlico, Perquimans, Tyrrell, and Washington County Cluster**

(a) Enacted Map

(b) Duchin Map

Partisan Lean of Districts

District:	Enacted Plan	Duchin Plan
1 (6 in Duchin)	0.39	0.36
79	0.39	0.41

Note: Partisan index is based on the two-party vote average of 11 statewide partisan elections between 2014-2020.

Table 13: Simulation Results by Individual Elections

Beaufort, Chowan, Currituck, Dare, Hyde, Pamlico, Perquimans, Tyrrell, and Washington House County Cluster

Number of Democratic Leaning Districts:			
	0	1	2
Election Indices:	Percentage of Simulations		
All Elections Index	**100%**	0%	0%
Individual Elections:			
2020 President	**100%**	0%	0%
2020 Senate	**100%**	0%	0%
2020 Governor	**100%**	0%	0%
2020 Lt. Governor	**100%**	0%	0%
2020 Attorney General	**100%**	0%	0%
2016 President	**100%**	0%	0%
2016 Senate	**100%**	0%	0%
2016 Governor	**100%**	0%	0%
2016 Lt. Governor	**100%**	0%	0%
2016 Attorney General	**100%**	0%	0%
2014 Senate	**100%**	0%	0%

Note: Each row shows the percent of simulations that produce the number of Democratic leaning districts using the election or election index indicated in the row. The bolded number in each row is the number of Democratic leaning districts produced by the Enacted Plan using the equivalent election. For example, using the 2020 Presidential election 100% of the simulations produce 0 Democratic leaning districts. The Enacted Plan does as well, as the '0 District' cell is bolded in that row.

6.13 Buncombe House County Grouping

The Buncombe House county grouping contains 3 districts. In the Enacted Map these are Districts 114, 115, and 116. The county cluster has an overall partisan index of 0.60, which is moderately Democratic. After conducting 50,000 initial simulations to create three districts in this cluster, I would normally discard any simulations that contain more county traversals than the Enacted Plan. However, this grouping contains only one county, so all of the simulations will contain the same number of traversals as the Enacted Map. Next, I discard any simulations in which the average compactness score of the districts in the simulations is not as large or larger than the compactness score of the Enacted Map. This leaves 38,664 simulated maps, each containing three districts.

A map of the location of this county cluster in relation to the rest of the state is shown in Figure 42. A map of the Enacted Map's district boundaries and the Duchin Map's district boundaries within this county grouping are shown in Figure 43.

The distribution of district partisanship based on the statewide partisan elections index calculated for each of the simulation results is shown in Figure 45. The black bars show the distribution from the simulation results, with the percentage of simulations that generate each of the various possible number of Democratic seats in the cluster shown below each bar. The red vertical line shows the number of Democratic leaning seats in the Enacted Map in the same cluster, and the vertical dashed green line shows the number of Democratic leaning seats in the Duchin Map in the cluster. In 28% of the simulations there are 2 Democratic leaning districts. in 72% oft he simulations there are three Democratic leaning districts. The Enacted Map is in alignment with the minority outcome of the simulations by also creating 2 Democratic districts. The Duchin Map generates 3 Democratic districts.

Table 15 breaks apart the partisan index into the 11 constituent elections and shows the distribution of Democratic leaning seats generated if one were to look at each election separately. Each row shows the percent of simulations that produce the number of Democratic leaning districts using the election or election index indicated in the row. The bolded

number in each row is the number of Democratic leaning districts produced by the Enacted Plan using the equivalent election. In this case the Enacted Plan creates 2 Democratic leaning districts, regardless of the election considered. However, the frequency with which the simulations produce 2 Democratic districts varies from a low of 2% in the 2020 Governor race to a 51% majority in the 2016 Presidential race.

One consideration for why the Enacted Plan diverges from the Duchin Plan and the modal outcome of the simulations is because it keeps a larger portion of the town of Asheville, the county seat and largest city in Buncombe County, in fewer districts. Figure 44 shows a map of the city and how the two different plans divide the city. The Duchin Plan splits Asheville nearly equally across all three districts in a pie shape while the Enacted Plan keeps much more of Asheville within two districts. There is a small portion of the southern most part of the city in District 116. The tactic of dividing Democratic cities in a 'pinwheel' or 'pizza' shape and grouping those 'slices' with more Republican suburban and exurban areas is a classic tactic to generate more Democratic districts and overcome the geographic clustering that is common among Democratic voters. The Enacted Plan keeps much more of Asheville within two districts. Table 14 shows the percent of Asheville voters in each district in each plan. It is clear that the Duchin plan splits Ashville into three roughly equal parts while the Enacted Plan places a much larger majority of Asheville into only two districts.

Table 14: Division of Asheville in Enacted Plan and Duchin Plan

	Percent of Asheville in district	
District:	Enacted Plan	Duchin Plan
114	55.6	27.7
115	30.9	39.9
116	13.5	32.5
Total:	100%	100%

Note: Population number for city by district for Enacted Plan from: `https://ncleg.gov/Files/GIS/Plans_Main/Senate_2021/SL%202021-173%20Senate%20-%20StatPack%20Report.pdf` Population numbers for city by district for Duchin Plan from Dave's Redistricting online. `https://davesredistricting.org/`

The black bars show the distribution from the simulation results, with the percentage of simulations that generate each of the various possible number of Democratic seats in the cluster shown below each bar. The red vertical line shows the number of Democratic leaning seats in the Enacted Map in the same cluster, and the vertical dashed green line shows the number of Democratic leaning seats in the Duchin Map in the cluster.

Table 15: Simulation Results by Individual Elections

Buncombe House County Cluster

Number of Democratic Leaning Districts:				
	0	1	2	3
Individual Elections:				
2020 President	0%	0%	**26%**	74%
2020 Senate	0%	0%	**23%**	77%
2020 Governor	0%	0%	**2%**	98%
2020 Lt. Governor	0%	0%	**31%**	69%
2020 Attorney General	0%	0%	**16%**	84%
2016 President	0%	1%	**51%**	48%
2016 Senate	0%	1%	**46%**	53%
2016 Governor	0%	0%	**12%**	88%
2016 Lt. Governor	0%	1%	**43%**	56%
2016 Attorney General	0%	0%	**20%**	80%
2014 Senate	0%	0%	**24%**	76%

Note: Each row shows the percent of simulations that produce the number of Democratic leaning districts using the election or election index indicated in the row. The bolded number in each row is the number of Democratic leaning districts produced by the Enacted Plan using the equivalent election. For example, using the 2020 Presidential election 26% of the simulations produce 2 Democratic leaning districts. The Enacted Plan does as well, as the '2 Districts' cell is bolded in that row.

6.14 Anson and Union House County Grouping

The Anson-Union House county grouping contains 3 districts. In the Enacted Map these are Districts 55, 68 and 69. The county cluster has an overall partisan index of .37, which is strongly Republican. After conducting 50,000 initial simulations to create three districts in this cluster, I discard any simulations that contain more county traversals than the Enacted Plan. This leaves 43,555 simulated maps. Next, I discard any simulations in which the average compactness score of the districts in the simulations is not as large or larger than the compactness score of the Enacted Map. This leaves 20,759 simulated maps, each containing three districts.

A map of the location of this county cluster in relation to the rest of the state is shown in Figure 46. A map of the Enacted Map's district boundaries and the Duchin Map's district boundaries within this county grouping are shown in Figure 47.

The distribution of district partisanship based on the statewide partisan elections index calculated for each of the simulation results is shown in Figure 48. The black bars show the distribution from the simulation results, with the percentage of simulations that generate each of the various possible number of Democratic seats in the cluster shown below each bar. The red vertical line shows the number of Democratic leaning seats in the Enacted Map in the same cluster, and the vertical dashed green line shows the number of Democratic leaning seats in the Duchin Map in the cluster. In 100% of the simulations there are 0 Democratic leaning districts. The Enacted Map is in alignment with the modal outcome of the simulations by also creating 0 Democratic districts. The Duchin Map also generates 0 Democratic districts.

Table 16 breaks apart the partisan index into the 11 constituent elections and shows the distribution of Democratic leaning seats generated if one were to look at each election separately. Each row shows the percent of simulations that produce the number of Democratic leaning districts using the election or election index indicated in the row. The bolded number in each row is the number of Democratic leaning districts produced by the Enacted

Plan using the equivalent election. In this case there is unanimous agreement between the modal outcome in the simulations and the Enacted Map across all 11 elections.

2016 Attorney General	**100%**	0%	0%	0%
2014 Senate	**73%**	27%	0%	0%

Note: Each row shows the percent of simulations that produce the number of Democratic leaning districts using the election or election index indicated in the row. The bolded number in each row is the number of Democratic leaning districts produced by the Enacted Plan using the equivalent election. For example, using the 2020 Presidential election 100% of the simulations produce 0 Democratic leaning districts. The Enacted Plan does as well, as the '0 District' cell is bolded in that row.

6.15 Onslow and Pender House County Grouping

The Onslow-Pender House county grouping contains 3 districts. In the Enacted Map these are Districts 14, 15, and 16. The county cluster has an overall partisan index of .35, which is heavily Republican. After conducting 50,000 initial simulations to create three districts in this cluster, I discard any simulations that contain more county traversals than the Enacted Plan. This leaves 48,928 simulated maps. Next, I discard any simulations in which the average compactness score of the districts in the simulations is not as large or larger than the compactness score of the Enacted Map. This leaves 35,873 simulated maps, each containing three districts.

A map of the location of this county cluster in relation to the rest of the state is shown in Figure 49. A map of the Enacted Map's district boundaries and the Duchin Map's district boundaries within this county grouping are shown in Figure 50.

The distribution of district partisanship based on the statewide partisan elections index calculated for each of the simulation results is shown in Figure 51. The black bars show the distribution from the simulation results, with the percentage of simulations that generate each of the various possible number of Democratic seats in the cluster shown below each bar. The red vertical line shows the number of Democratic leaning seats in the Enacted Map in the same cluster, and the vertical dashed green line shows the number of Democratic leaning seats in the Duchin Map in the cluster. In 100% of the simulations there are 0 Democratic leaning districts. The Enacted Map is in alignment with the modal outcome of the simulations by also creating 0 Democratic districts. The Duchin Map also generates 0 Democratic districts.

Table 17 breaks apart the partisan index into the 11 constituent elections and shows the distribution of Democratic leaning seats generated if one were to look at each election separately. Each row shows the percent of simulations that produce the number of Democratic leaning districts using the election or election index indicated in the row. The bolded number in each row is the number of Democratic leaning districts produced by the Enacted

Plan using the equivalent election. In this case there is unanimous agreement between the modal outcome in the simulations and the Enacted Map across all 11 elections.

Note: Distribution of likely district partisanship based on the statewide partisan elections index calculated for each of the simulation results. The black bars show the distribution from the simulation results, with the percentage of simulations that generate each of the various possible number of Democratic seats in the cluster shown below each bar. The red vertical line shows the number of Democratic leaning seats in the Enacted Map in the same cluster, and the vertical dashed green line shows the number of Democratic leaning seats in the Duchin Map in the cluster.

Table 17: Simulation Results by Individual Elections

Onslow and Pender House County Cluster

Number of Democratic Leaning Districts:				
	0	1	2	3
Individual Elections:				
2020 President	**100%**	0%	0%	0%
2020 Senate	**100%**	0%	0%	0%
2020 Governor	**100%**	0%	0%	0%
2020 Lt. Governor	**100%**	0%	0%	0%
2020 Attorney General	**100%**	0%	0%	0%
2016 President	**100%**	0%	0%	0%
2016 Senate	**100%**	0%	0%	0%
2016 Governor	**100%**	0%	0%	0%
2016 Lt. Governor	**100%**	0%	0%	0%
2016 Attorney General	**100%**	0%	0%	0%
2014 Senate	**100%**	0%	0%	0%

Note: Each row shows the percent of simulations that produce the number of Democratic leaning districts using the election or election index indicated in the row. The bolded number in each row is the number of Democratic leaning districts produced by the Enacted Plan using the equivalent election. For example, using the 2020 Presidential election 100% of the simulations produce 0 Democratic leaning districts. The Enacted Plan does as well, as the '0 District' cell is bolded in that row.

6.16 Cumberland House County Grouping

The Cumberland House county group contains 4 districts. In the Enacted Map these are Districts 42, 43, 44, and 45. The county cluster has an overall partisan index of .59, which is moderately Democratic. After conducting 50,000 initial simulations to create four districts in this cluster, I would normally discard any simulations that contain more county traversals than the Enacted Plan. However, Cumberland is a single county group, and so all of the simulations have the same number of traversals as the Enacted Map. Next, I discard any simulations in which the average compactness score of the districts in the simulations is not as large or larger than the compactness score of the Enacted Map. This leaves 10,521 simulated maps, each containing four districts.

A map of the location of this county cluster in relation to the rest of the state is shown in Figure 52. A map of the Enacted Map's district boundaries and the Duchin Map's district boundaries within this county grouping are shown in Figure 53.

The distribution of district partisanship based on the statewide partisan elections index calculated for each of the simulation results is shown in Figure 55. The black bars show the distribution from the simulation results, with the percentage of simulations that generate each of the various possible number of Democratic seats in the cluster shown below each bar. The red vertical line shows the number of Democratic leaning seats in the Enacted Map in the same cluster, and the vertical dashed green line shows the number of Democratic leaning seats in the Duchin Map in the cluster. In 82% of the simulations there are 3 Democratic leaning districts. The Enacted Map is in alignment with the modal outcome of the simulations by also creating 3 Democratic districts. In 18% of the simulations there are 4 Democratic leaning districts. The Duchin Map generates 4 Democratic districts. This falls outside of the 50% range of simulation results and is thus classified as a partisan outlier result.

Table 19 breaks apart the partisan index into the 11 constituent elections and shows the distribution of Democratic leaning seats generated if one were to look at each election

separately. Each row shows the percent of simulations that produce the number of Democratic leaning districts using the election or election index indicated in the row. The bolded number in each row is the number of Democratic leaning districts produced by the Enacted Plan using the equivalent election. In 5 of the 11 elections there is agreement between the modal outcome in the simulations and the Enacted Map. In 6 of the 11 elections the Enacted Plan results fall outside the middle 50% range of the simulations and would be classified as outliers.

One consideration for why the Enacted Plan diverges from the Duchin Plan is because it keeps a larger portion of the town of Fayetteville, the county seat and largest city in Cumberland County, in fewer districts. Figure 54 shows a map of the city and how the two different plans divide the city. The Duchin Plan splits Fayetteville nearly equally across all four districts in a pie shape. The tactic of dividing Democratic cities in a 'pinwheel' or 'pizza' shape and grouping those 'slices' with more Republican suburban and exurban areas is a classic tactic to generate more Democratic districts and overcome the geographic clustering that is common among Democratic voters. The Enacted Plan keeps much more of Fayetteville within three districts. A small portion of the southern most part of the city is located in District 45. Table 18 shows the percent of Fayetteville voters in each district in each plan. It is clear that the Duchin plan splits Fayetteville into 4 roughly equal parts while the Enacted Plan places a much larger majority of Fayetteville into only three districts.

Table 18: Division of Fayetteville in Enacted Plan and Duchin Plan

	Percent of Feyetville in district	
District:	Enacted Plan	Duchin Plan
42	31.4	33.4
43	21.4	21.5
44	39.9	26.8
45	7.3	18.3
Total:	100%	100%

Note: Population number for city by district for Enacted Plan from: `https://ncleg.gov/Files/GIS/Plans_Main/Senate_2021/SL%202021-173%20Senate%20-%20StatPack%20Report.pdf` Population numbers for city by district for Duchin Plan from Dave's Redistricting online. `https://davesredistricting.org/`

Note: Distribution of likely district partisanship based on the statewide partisan elections index calculated for each of the simulation results. The black bars show the distribution from the simulation results, with the percentage of simulations that generate each of the various possible number of Democratic seats in the cluster shown below each bar. The red vertical line shows the number of Democratic leaning seats in the Enacted Map in the same cluster, and the vertical dashed green line shows the number of Democratic leaning seats in the Duchin Map in the cluster.

Table 19: Simulation Results by Individual Elections

Cumberland House County Cluster

	Number of Democratic Leaning Districts:				
	0	1	2	3	4
Individual Elections:					
2020 President	0%	0%	**0%**	91%	9%
2020 Senate	0%	0%	**0%**	88%	12%
2020 Governor	0%	0%	0%	23%	**77%**
2020 Lt. Governor	0%	0%	**0%**	90%	10%
2020 Attorney General	0%	0%	0%	49%	**51%**
2016 President	0%	0%	0%	**90%**	10%
2016 Senate	0%	0%	**0%**	94%	6%
2016 Governor	0%	0%	**0%**	94%	6%
2016 Lt. Governor	0%	0%	**0%**	94%	6%
2016 Attorney General	0%	0%	0%	**48%**	52%
2014 Senate	0%	0%	0%	**89%**	11%

Note: Each row shows the percent of simulations that produce the number of Democratic leaning districts using the election or election index indicated in the row. The bolded number in each row is the number of Democratic leaning districts produced by the Enacted Plan using the equivalent election. For example, using the 2020 Presidential election 0% of the simulations produce 2 Democratic leaning districts. The Enacted Plan does as well, as the '3 Districts' cell is bolded in that row.

One thing to note regarding the instances in which the Enacted Plan does not align with the simulation results in individual elections. In all six cases the Enacted Plan creates one district (and occasionally two districts) that is extremely competitive and is effectively tied (less than 1% from 50/50), but is just below 0.50 and is thus not classified as a Democratic district. For example, in the 2020 Presidential race the Enacted Plan districts have a partisan lean of 0.719, 0.672, 0.495, and 0.492. Thus, two of the districts, while not classified as Democratic leaning will be heavily contested and both parties will likely win these districts at different times in the coming years.

6.17 Harnett and Johnston House County Grouping

The Harnett-Johnston House county group contains 4 districts. In the Enacted Map these are Districts 6, 26, 28, and 53. The county cluster has an overall partisan index of .38, which is moderately Republican. After conducting 50,000 initial simulations to create four districts in this cluster, I discard any simulations that contain more county traversals than the Enacted Plan. This leaves 34,976 simulations. Next, I discard any simulations in which the average compactness score of the districts in the simulations is not as large or larger than the compactness score of the Enacted Map. This leaves 593 simulated maps, each containing four districts.

A map of the location of this county cluster in relation to the rest of the state is shown in Figure 56. A map of the Enacted Map's district boundaries and the Duchin Map's district boundaries within this county grouping are shown in Figure 57.

The distribution of district partisanship based on the statewide partisan elections index calculated for each of the simulation results is shown in Figure 58. The black bars show the distribution from the simulation results, with the percentage of simulations that generate each of the various possible number of Democratic seats in the cluster shown below each bar. The red vertical line shows the number of Democratic leaning seats in the Enacted Map in the same cluster, and the vertical dashed green line shows the number of Democratic leaning seats in the Duchin Map in the cluster. In 100% of the simulations there are 0 Democratic leaning districts. The Enacted Map is in alignment with the modal outcome of the simulations by also creating 0 Democratic districts. The Duchin Map also generates 0 Democratic districts.

Table 20 breaks apart the partisan index into the 11 constituent elections and shows the distribution of Democratic leaning seats generated if one were to look at each election separately. Each row shows the percent of simulations that produce the number of Democratic leaning districts using the election or election index indicated in the row. The bolded number in each row is the number of Democratic leaning districts produced by the Enacted

Plan using the equivalent election. In all 11 of the individual elections there is agreement between the modal outcome in the simulations and the Enacted Map.

2020 Senate	**100%**	0%	0%	0%	0%
2020 Governor	**100%**	0%	0%	0%	0%
2020 Lt. Governor	**100%**	0%	0%	0%	0%
2020 Attorney General	**100%**	0%	0%	0%	0%
2016 President	**100%**	0%	0%	0%	0%
2016 Senate	**100%**	0%	0%	0%	0%
2016 Governor	**100%**	0%	0%	0%	0%
2016 Lt. Governor	**100%**	0%	0%	0%	0%
2016 Attorney General	**100%**	0%	0%	0%	0%
2014 Senate	**100%**	0%	0%	0%	0%

Note: Each row shows the percent of simulations that produce the number of Democratic leaning districts using the election or election index indicated in the row. The bolded number in each row is the number of Democratic leaning districts produced by the Enacted Plan using the equivalent election. For example, using the 2020 Presidential election 100% of the simulations produce 0 Democratic leaning districts. The Enacted Plan does as well, as the '0 District' cell is bolded in that row.

6.18 Catawba and Iredell House County Grouping

The Catawba-Iredell House county group contains 4 districts. In the Enacted Map these are Districts 84, 89, 95, and 96. The county cluster has an overall partisan index of .33, which is strongly Republican. After conducting 50,000 initial simulations to create four districts in this cluster, I discard any simulations that contain more county traversals than the Enacted Plan. This leaves 14,955 simulations. Next, I discard any simulations in which the average compactness score of the districts in the simulations is not as large or larger than the compactness score of the Enacted Map. This leaves 2,944 simulated maps, each containing four districts.

A map of the location of this county cluster in relation to the rest of the state is shown in Figure 59. A map of the Enacted Map's district boundaries and the Duchin Map's district boundaries within this county grouping are shown in Figure 60.

The distribution of district partisanship based on the statewide partisan elections index calculated for each of the simulation results is shown in Figure 61. The black bars show the distribution from the simulation results, with the percentage of simulations that generate each of the various possible number of Democratic seats in the cluster shown below each bar. The red vertical line shows the number of Democratic leaning seats in the Enacted Map in the same cluster, and the vertical dashed green line shows the number of Democratic leaning seats in the Duchin Map in the cluster. In 100% of the simulations there are 0 Democratic leaning districts. The Enacted Map is in alignment with the modal outcome of the simulations by also creating 0 Democratic districts. The Duchin Map also generates 0 Democratic districts.

Table 21 breaks apart the partisan index into the 11 constituent elections and shows the distribution of Democratic leaning seats generated if one were to look at each election separately. Each row shows the percent of simulations that produce the number of Democratic leaning districts using the election or election index indicated in the row. The bolded number in each row is the number of Democratic leaning districts produced by the Enacted

Plan using the equivalent election. In all 11 of the individual elections there is agreement between the modal outcome in the simulations and the Enacted Map.

2016 Attorney General	**100%**	0%	0%	0%	0%
2014 Senate	**100%**	0%	0%	0%	0%

Note: Each row shows the percent of simulations that produce the number of Democratic leaning districts using the election or election index indicated in the row. The bolded number in each row is the number of Democratic leaning districts produced by the Enacted Plan using the equivalent election. For example, using the 2020 Presidential election 100% of the simulations produce 0 Democratic leaning districts. The Enacted Plan does as well, as the '0 District' cell is bolded in that row.

6.19 Durham and Person House County Grouping

The Durham-Person House county group contains 4 districts. In the Enacted Map these are Districts 2, 29, 30, and 31. The county cluster has an overall partisan index of .76, which is strongly Democratic. After conducting 50,000 initial simulations to create four districts in this cluster, I discard any simulations that contain more county traversals than the Enacted Plan. This leaves 49,896 simulations. Next, I discard any simulations in which the average compactness score of the districts in the simulations is not as large or larger than the compactness score of the Enacted Map. This leaves 37,800 simulated maps, each containing four districts.

A map of the location of this county cluster in relation to the rest of the state is shown in Figure 62. A map of the Enacted Map's district boundaries and the Duchin Map's district boundaries within this county grouping are shown in Figure 63.

The distribution of district partisanship based on the statewide partisan elections index calculated for each of the simulation results is shown in Figure 64. The black bars show the distribution from the simulation results, with the percentage of simulations that generate each of the various possible number of Democratic seats in the cluster shown below each bar. The red vertical line shows the number of Democratic leaning seats in the Enacted Map in the same cluster, and the vertical dashed green line shows the number of Democratic leaning seats in the Duchin Map in the cluster. In 100% of the simulations there are 4 Democratic leaning districts. The Enacted Map is in alignment with the modal outcome of the simulations by also creating 4 Democratic districts. The Duchin Map also generates 4 Democratic districts.

Table 22 breaks apart the partisan index into the 11 constituent elections and shows the distribution of Democratic leaning seats generated if one were to look at each election separately. Each row shows the percent of simulations that produce the number of Democratic leaning districts using the election or election index indicated in the row. The bolded number in each row is the number of Democratic leaning districts produced by the Enacted

Plan using the equivalent election. In all 11 of the individual elections there is agreement between the modal outcome in the simulations and the Enacted Map.

2016 Senate	0%	0%	0%	**0%**	100%
2016 Governor	0%	0%	0%	0%	**100%**
2016 Lt. Governor	0%	0%	0%	**0%**	100%
2016 Attorney General	0%	0%	0%	0%	**100%**
2014 Senate	0%	0%	0%	0%	**100%**

Note: Each row shows the percent of simulations that produce the number of Democratic leaning districts using the election or election index indicated in the row. The bolded number in each row is the number of Democratic leaning districts produced by the Enacted Plan using the equivalent election. For example, using the 2020 Presidential election 100% of the simulations produce 4 Democratic leaning districts. The Enacted Plan does as well, as the '4 District' cell is bolded in that row.

6.20 Brunswick and New Hanover House County Grouping

The Brunswick-New Hanover House county group contains 4 districts. In the Enacted Map these are Districts 17, 18, 19, and 20. The county cluster has an overall partisan index of .45, which is Republican leaning. After conducting 50,000 initial simulations to create four districts in this cluster, I discard any simulations that contain more county traversals than the Enacted Plan. This leaves 12,087 simulations. Next, I discard any simulations in which the average compactness score of the districts in the simulations is not as large or larger than the compactness score of the Enacted Map. This leaves 562 simulated maps, each containing four districts.

A map of the location of this county cluster in relation to the rest of the state is shown in Figure 65. A map of the Enacted Map's district boundaries and the Duchin Map's district boundaries within this county grouping are shown in Figure 66.

The distribution of district partisanship based on the statewide partisan elections index calculated for each of the simulation results is shown in Figure 67. The black bars show the distribution from the simulation results, with the percentage of simulations that generate each of the various possible number of Democratic seats in the cluster shown below each bar. The red vertical line shows the number of Democratic leaning seats in the Enacted Map in the same cluster, and the vertical dashed green line shows the number of Democratic leaning seats in the Duchin Map in the cluster. In 100% of the simulations there is 1 Democratic leaning district. The Enacted Map is in alignment with the modal outcome of the simulations by also creating 1 Democratic district. The Duchin Map generates 2 Democratic districts. The Duchin Map does not align with any of the simulations because it is less compact (average Polsby-Popper score of 0.35) than the Enacted Map (average Polsby-Popper score of 0.36) and the simulated maps, which are constrained to be at least as compact, on average, as the Enacted Map. This is evident by looking at the maps of the districts in the Duchin Plan. District 20 is a long and narrow district that begins south of Wilmington (the largest city in the cluster), takes in the eastern side of Wilmington, which

is more Republican, and then loops around to the north west. In doing this, the Duchin map then splits the more Democratic portion of Wilmington between districts 18 and 19 in order to create two Democratic leaning districts. As a result, the town of Wilmington is a part of districts 18, 19, and 20. This is also true of the Enacted Map, however, the Enacted map does this while creating more compact districts.

Table 23 breaks apart the partisan index into the 11 constituent elections and shows the distribution of Democratic leaning seats generated if one were to look at each election separately. Each row shows the percent of simulations that produce the number of Democratic leaning districts using the election or election index indicated in the row. The bolded number in each row is the number of Democratic leaning districts produced by the Enacted Plan using the equivalent election. In 10 of the 11 individual elections there is agreement between the modal outcome in the simulations and the Enacted Map. In the 1 scenario in which they do not agree (2020 Governor race), the Enacted Map generates one more Democratic district than the simulations do.

2020 Senate	0%	**100%**	0%	0%	0%
2020 Governor	0%	100%	**0%**	0%	0%
2020 Lt. Governor	0%	**100%**	0%	0%	0%
2020 Attorney General	0%	**100%**	0%	0%	0%
2016 President	0%	**100%**	0%	0%	0%
2016 Senate	0%	**100%**	0%	0%	0%
2016 Governor	0%	**100%**	0%	0%	0%
2016 Lt. Governor	0%	**100%**	0%	0%	0%
2016 Attorney General	0%	**100%**	0%	0%	0%
2014 Senate	0%	**100%**	0%	0%	0%

Note: Each row shows the percent of simulations that produce the number of Democratic leaning districts using the election or election index indicated in the row. The bolded number in each row is the number of Democratic leaning districts produced by the Enacted Plan using the equivalent election. For example, using the 2020 Presidential election 100% of the simulations produce 1 Democratic leaning district. The Enacted Plan does as well, as the '1 District' cell is bolded in that row.

6.21 Forsyth and Stokes House County Grouping

The Forsyth-Stokes House county group contains 5 districts. In the Enacted Map these are Districts 71, 72, 74, 75, and 91. The county cluster has an overall partisan index of .52, which is slightly Democratic leaning. After conducting 50,000 initial simulations to create five districts in this cluster, I discard any simulations that contain more county traversals than the Enacted Plan. This leaves 17,147 simulations. Next, I discard any simulations in which the average compactness score of the districts in the simulations is not as large or larger than the compactness score of the Enacted Map. This leaves 3,726 simulated maps, each containing five districts.

A map of the location of this county cluster in relation to the rest of the state is shown in Figure 68. A map of the Enacted Map's district boundaries and the Duchin Map's district boundaries within this county grouping are shown in Figure 69. I also include the 2020 map's boundaries for comparison.

The distribution of district partisanship based on the statewide partisan elections index calculated for each of the simulation results is shown in Figure 70. The black bars show the distribution from the simulation results, with the percentage of simulations that generate each of the various possible number of Democratic seats in the cluster shown below each bar. The red vertical line shows the number of Democratic leaning seats in the Enacted Map in the same cluster, and the vertical dashed green line shows the number of Democratic leaning seats in the Duchin Map in the cluster. In 33% of the simulations there are 2 Democratic leaning districts. In 50% of the simulations there are 3 Democratic leaning districts, and in 17% of the simulations there are 4 Democratic leaning districts. The Enacted Map creates 2 Democratic districts. The Duchin Map also generates 2 Democratic districts.

Table 24 breaks apart the partisan index into the 11 constituent elections and shows the distribution of Democratic leaning seats generated if one were to look at each election separately. Each row shows the percent of simulations that produce the number of Democratic leaning districts using the election or election index indicated in the row. The bolded

number in each row is the number of Democratic leaning districts produced by the Enacted Plan using the equivalent election. In 10 of the 11 individual elections the Enacted Map generates 2 Democratic districts. In 1 scenario (2020 Governor race), the Enacted Map generates 3 Democratic districts.

The Enacted Plan is also extremely similar to the maps used in Forsyth County in the 2020 elections. These districts were approved by a court in 2019. The county grouping was different, and Forsyth was combined with Yadkin County in 2020, however, in both plans the less populous county is kept whole and combined with a portion of Forsyth County. Within the more populated Forsyth County, the boundaries are extremely similar. The Enacted Plan is different by only 5 precincts total, and no district differs from the 2020 maps by more than a 3 precinct shift.

2016 Governor	0%	0%	**21%**	55%	24%	0%
2016 Lt. Governor	0%	4%	**66%**	30%	0%	0%
2016 Attorney General	0%	0%	**25%**	56%	19%	0%
2014 Senate	0%	3%	**58%**	38%	1%	0%

Note: Each row shows the percent of simulations that produce the number of Democratic leaning districts using the election or election index indicated in the row. The bolded number in each row is the number of Democratic leaning districts produced by the Enacted Plan using the equivalent election. For example, using the 2020 Presidential election 14% of the simulations produce 2 Democratic leaning districts. The Enacted Plan does as well, as the '2 District' cell is bolded in that row.

6.22 Cabarrus, Davie, Rowan, and Yadkin House County Grouping

The Cabarrus-Davie-Rowan-Yadkin House county group contains 5 districts. In the Enacted Map these are Districts 73, 76, 77, 82, and 83. The county cluster has an overall partisan index of .36, which is strongly Republican. After conducting 50,000 initial simulations to create five districts in this cluster, I discard any simulations that contain more county traversals than the Enacted Plan. This leaves 6,649 simulations. Next, I discard any simulations in which the average compactness score of the districts in the simulations is not as large or larger than the compactness score of the Enacted Map. This leaves 283 simulated maps, each containing five districts.

A map of the location of this county cluster in relation to the rest of the state is shown in Figure 71. A map of the Enacted Map's district boundaries and the Duchin Map's district boundaries within this county grouping are shown in Figure 72.

The distribution of district partisanship based on the statewide partisan elections index calculated for each of the simulation results is shown in Figure 73. The black bars show the distribution from the simulation results, with the percentage of simulations that generate each of the various possible number of Democratic seats in the cluster shown below each bar. The red vertical line shows the number of Democratic leaning seats in the Enacted Map in the same cluster, and the vertical dashed green line shows the number of Democratic leaning seats in the Duchin Map in the cluster. In 99% of the simulations there are 0 Democratic leaning districts. The Enacted Map creates 0 Democratic districts. The Duchin Map also generates 0 Democratic districts.

Table 25 breaks apart the partisan index into the 11 constituent elections and shows the distribution of Democratic leaning seats generated if one were to look at each election separately. Each row shows the percent of simulations that produce the number of Democratic leaning districts using the election or election index indicated in the row. The bolded number in each row is the number of Democratic leaning districts produced by the Enacted

Plan using the equivalent election. In all of the 11 individual elections the Enacted Map generates 0 Democratic districts and is in agreement with the majority of the simulations results in 8 of the 11 individual elections considered.

2016 Attorney General	**100%**	0%	0%	0%	0%	0%
2014 Senate	**100%**	0%	0%	0%	0%	0%

Note: Each row shows the percent of simulations that produce the number of Democratic leaning districts using the election or election index indicated in the row. The bolded number in each row is the number of Democratic leaning districts produced by the Enacted Plan using the equivalent election. For example, using the 2020 Presidential election 10% of the simulations produce 0 Democratic leaning districts. The Enacted Plan does as well, as the '0 District' cell is bolded in that row.

6.23 Chatham, Lee, Moore, Randolph, and Richmond House County Grouping

The Chatham-Lee-Moore-Randolph-Richmond House county group contains 5 districts. In the Enacted Map these are Districts 51, 52, 54, 70, and 78. The county cluster has an overall partisan index of .38, which is strongly Republican. After conducting 50,000 initial simulations to create five districts in this cluster, I discard any simulations that contain more county traversals than the Enacted Plan. This leaves 1,868 simulations. Next, I discard any simulations in which the average compactness score of the districts in the simulations is not as large or larger than the compactness score of the Enacted Map. This leaves 939 simulated maps, each containing five districts.

A map of the location of this county cluster in relation to the rest of the state is shown in Figure 74. A map of the Enacted Map's district boundaries and the Duchin Map's district boundaries within this county grouping are shown in Figure 75.

The distribution of district partisanship based on the statewide partisan elections index calculated for each of the simulation results is shown in Figure 76. The black bars show the distribution from the simulation results, with the percentage of simulations that generate each of the various possible number of Democratic seats in the cluster shown below each bar. The red vertical line shows the number of Democratic leaning seats in the Enacted Map in the same cluster, and the vertical dashed green line shows the number of Democratic leaning seats in the Duchin Map in the cluster. In 18% of the simulations there are 0 Democratic leaning districts. In 82% of the simulations there is 1 Democratic leaning district. The Enacted Map creates 1 Democratic district. The Duchin Map also generates 1 Democratic district.

Table 26 breaks apart the partisan index into the 11 constituent elections and shows the distribution of Democratic leaning seats generated if one were to look at each election separately. Each row shows the percent of simulations that produce the number of Democratic leaning districts using the election or election index indicated in the row. The bolded

number in each row is the number of Democratic leaning districts produced by the Enacted Plan using the equivalent election. In all of the 11 individual elections the Enacted Map generates 1 Democratic district and is in agreement with the majority of the simulations results in all 11 individual elections considered.

52	0.44	0.35
54	0.54	0.58
70	0.25	0.24
78	0.26	0.27

Note: Partisan index is based on the two-party vote average of 11 statewide partisan elections between 2014-2020.

Figure 76: **Distribution of Partisan Districts from Simulations in Chatham, Lee, Moore, Randolph, and Richmond House County Cluster**

Note: Distribution of likely district partisanship based on the statewide partisan elections index calculated for each of the simulation results. The black bars show the distribution from the simulation results, with the percentage of simulations that generate each of the various possible number of Democratic seats in the cluster shown below each bar. The red vertical line shows the number of Democratic leaning seats in the Enacted Map in the same cluster, and the vertical dashed green line shows the number of Democratic leaning seats in the Duchin Map in the cluster.

Table 26: Simulation Results by Individual Elections

Chatham, Lee, Moore, Randolph, and Richmond House County Cluster

	Number of Democratic Leaning Districts:					
	0	1	2	3	4	5
Individual Elections:						
2020 President	17%	**83%**	0%	0%	0%	0%
2020 Senate	18%	**82%**	0%	0%	0%	0%
2020 Governor	0%	**100%**	0%	0%	0%	0%
2020 Lt. Governor	18%	**82%**	0%	0%	0%	0%
2020 Attorney General	15%	**85%**	0%	0%	0%	0%
2016 President	18%	**82%**	0%	0%	0%	0%
2016 Senate	19%	**81%**	0%	0%	0%	0%
2016 Governor	15%	**85%**	0%	0%	0%	0%
2016 Lt. Governor	29%	**71%**	0%	0%	0%	0%
2016 Attorney General	14%	**86%**	0%	0%	0%	0%
2014 Senate	15%	**85%**	0%	0%	0%	0%

Note: Each row shows the percent of simulations that produce the number of Democratic leaning districts using the election or election index indicated in the row. The bolded number in each row is the number of Democratic leaning districts produced by the Enacted Plan using the equivalent election. For example, using the 2020 Presidential election 83% of the simulations produce 1 Democratic leaning district. The Enacted Plan does as well, as the '1 District' cell is bolded in that row.

6.24 Guilford House County Grouping

The Guilford House county group contains 6 districts. In the Enacted Map these are Districts 57, 58, 59, 60, 61, and 62. The county cluster has an overall partisan index of .61, which is strongly Democratic. After conducting 50,000 initial simulations to create six districts in this cluster, I would normally discard any simulations that contain more county traversals than the Enacted Plan. However, this grouping contains only one county, and thus the Enacted Plan will contain as many traversals as all of the simulations. Next, I discard any simulations in which the average compactness score of the districts in the simulations is not as large or larger than the compactness score of the Enacted Map. This leaves 15,489 simulated maps, each containing six districts.

A map of the location of this county cluster in relation to the rest of the state is shown in Figure 77. A map of the Enacted Map's district boundaries and the Duchin Map's district boundaries within this county grouping are shown in Figure 78. I also include the map of districts in this county from the 2020 plan for comparison here.

The distribution of district partisanship based on the statewide partisan elections index calculated for each of the simulation results is shown in Figure 79. The black bars show the distribution from the simulation results, with the percentage of simulations that generate each of the various possible number of Democratic seats in the cluster shown below each bar. The red vertical line shows the number of Democratic leaning seats in the Enacted Map in the same cluster, and the vertical dashed green line shows the number of Democratic leaning seats in the Duchin Map in the cluster. In 1% of the simulations there are 4 Democratic leaning districts. In 79% of the simulations there is 5 Democratic leaning district. in 21% of the simulations there are 6 Democratic districts. The Enacted Map creates 4 Democratic districts. The Duchin Map generates 5 Democratic districts.

Table 27 breaks apart the partisan index into the 11 constituent elections and shows the distribution of Democratic leaning seats generated if one were to look at each election separately. Each row shows the percent of simulations that produce the number of Demo-

cratic leaning districts using the election or election index indicated in the row. The bolded number in each row is the number of Democratic leaning districts produced by the Enacted Plan using the equivalent election. In 10 of the 11 individual elections the Enacted Map generates 4 Democratic districts and in 1 election (2020 Governor) the map contains 5 Democratic leaning districts.

An important point to consider when looking at the Enacted Map is that it closely adheres to the map used in Guilford County the 2020 election, which was approved by a court in 2019. The Enacted Plan is different by only four precincts. District 57 is identical across the two plans. Districts 59, 61, and 62 differ from the 2020 map by only 1 precinct each. District 60 differs from the 2020 map by 2 precincts and District 58 differs by only 3 precincts.

60	0.64	0.57
61	0.74	0.80
62	0.43	0.48

Note: Partisan index is based on the two-party vote average of 11 statewide partisan elections between 2014-2020.

Figure 79: **Distribution of Partisan Districts from Simulations in Guilford House County Cluster**

Note: Distribution of likely district partisanship based on the statewide partisan elections index calculated for each of the simulation results. The black bars show the distribution from the simulation results, with the percentage of simulations that generate each of the various possible number of Democratic seats in the cluster shown below each bar. The red vertical line shows the number of Democratic leaning seats in the Enacted Map in the same cluster, and the vertical dashed green line shows the number of Democratic leaning seats in the Duchin Map in the cluster.

Table 27: Simulation Results by Individual Elections

Guilford HouseCounty Cluster

	Number of Democratic Leaning Districts:						
	0	1	2	3	4	5	6
Individual Elections:							
2020 President	0%	0%	0%	0%	**0%**	41%	59%
2020 Senate	0%	0%	0%	0%	**0%**	73%	27%
2020 Governor	0%	0%	0%	0%	0%	**1%**	99%
2020 Lt. Governor	0%	0%	0%	0%	**1%**	80%	19%
2020 Attorney General	0%	0%	0%	0%	**0%**	53%	47%
2016 President	0%	0%	0%	0%	**2%**	84%	13%
2016 Senate	0%	0%	0%	0%	**7%**	90%	3%
2016 Governor	0%	0%	0%	0%	**0%**	44%	56%
2016 Lt. Governor	0%	0%	0%	0%	**8%**	90%	3%
2016 Attorney General	0%	0%	0%	0%	**1%**	82%	17%
2014 Senate	0%	0%	0%	0%	**21%**	78%	1%

Note: Each row shows the percent of simulations that produce the number of Democratic leaning districts using the election or election index indicated in the row. The bolded number in each row is the number of Democratic leaning districts produced by the Enacted Plan using the equivalent election. For example, using the 2020 Presidential election 0% of the simulations produce 4 Democratic leaning districts. The Enacted Plan does, as the '1 District' cell is bolded in that row.

6.25 Avery, Cleveland, Gaston, Henderson, McDowell, Mitchell, Polk, Rutherford, and Yancey House County Grouping

The Avery-Cleveland-Gaston-Henderson-McDowell-Mitchell-Polk-Rutherford-Yancey House county group contains 7 districts. In the Enacted Map these are Districts 85, 108, 109, 110, 111, 113, and 117. The county cluster has an overall partisan index of .35, which is strongly Republican. After conducting 50,000 initial simulations to create seven districts in this cluster, I discard any simulations that contain more county traversals than the Enacted Plan. This leaves 14,667 simulated plans. Next, I discard any simulations in which the average compactness score of the districts in the simulations is not as large or larger than the compactness score of the Enacted Map. This leaves 11,815 simulated maps, each containing seven districts.

A map of the location of this county cluster in relation to the rest of the state is shown in Figure 80. A map of the Enacted Map's district boundaries and the Duchin Map's district boundaries within this county grouping are shown in Figure 81.

The distribution of district partisanship based on the statewide partisan elections index calculated for each of the simulation results is shown in Figure 82. The black bars show the distribution from the simulation results, with the percentage of simulations that generate each of the various possible number of Democratic seats in the cluster shown below each bar. The red vertical line shows the number of Democratic leaning seats in the Enacted Map in the same cluster, and the vertical dashed green line shows the number of Democratic leaning seats in the Duchin Map in the cluster. In 100% of the simulations there are 0 Democratic leaning districts. The Enacted Map creates 0 Democratic leaning districts. The Duchin Map generates 0 Democratic leaning districts.

Table 28 breaks apart the partisan index into the 11 constituent elections and shows the distribution of Democratic leaning seats generated if one were to look at each election separately. Each row shows the percent of simulations that produce the number of Democratic leaning districts using the election or election index indicated in the row. The bolded

number in each row is the number of Democratic leaning districts produced by the Enacted Plan using the equivalent election. In all 11 of the individual elections the Enacted Map generates 0 Democratic districts and is in agreement with all of the simulated results across all 11 elections.

2016 Senate	**100%**	0%	0%
2016 Governor	**100%**	0%	0%
2016 Lt. Governor	**100%**	0%	0%
2016 Attorney General	**100%**	0%	0%
2014 Senate	**100%**	0%	0%

Note: Each row shows the percent of simulations that produce the number of Democratic leaning districts using the election or election index indicated in the row. The bolded number in each row is the number of Democratic leaning districts produced by the Enacted Plan using the equivalent election. For example, using the 2020 Presidential election 100% of the simulations produce 0 Democratic leaning districts. The Enacted Plan does as well, as the '0 District' cell is bolded in that row.

6.26 Mecklenburg House County Grouping

The Mecklenburg House county group contains 13 districts. In the Enacted Map these are Districts 88, 92, 98, 99, 100, 101, 102, 103, 104, 105, 106, 107, and 112. The county cluster has an overall partisan index of .65, which is strongly Democratic. After conducting 50,000 initial simulations to create 13 districts in this cluster, I would normally discard any simulations that contain more county traversals than the Enacted Plan. However, this cluster is a single county, and thus, there are no traversals. Next, I discard any simulations in which the average compactness score of the districts in the simulations is not as large or larger than the compactness score of the Enacted Map. This leaves 3,161 simulated maps, each containing 13 districts.

A map of the location of this county cluster in relation to the rest of the state is shown in Figure 83. A map of the Enacted Map's district boundaries and the Duchin Map's district boundaries within this county grouping are shown in Figure 84.

The distribution of district partisanship based on the statewide partisan elections index calculated for each of the simulation results is shown in Figure 85. The black bars show the distribution from the simulation results, with the percentage of simulations that generate each of the various possible number of Democratic seats in the cluster shown below each bar. The red vertical line shows the number of Democratic leaning seats in the Enacted Map in the same cluster, and the vertical dashed green line shows the number of Democratic leaning seats in the Duchin Map in the cluster. In 1% of the simulations there are 10 Democratic leaning districts. In 56% of the simulations there are 11 Democratic leaning districts, and in 44% of the simulations there are 12 Democratic leaning districts. The Enacted Map aligns with the majority of simulations and creates 11 Democratic leaning districts. The Duchin Map generates 11 Democratic leaning districts as well.

Table 29 breaks apart the partisan index into the 11 constituent elections and shows the distribution of Democratic leaning seats generated if one were to look at each election separately. Each row shows the percent of simulations that produce the number of Demo-

cratic leaning districts using the election or election index indicated in the row. The bolded number in each row is the number of Democratic leaning districts produced by the Enacted Plan using the equivalent election. Across the 11 individual elections the Enacted Map generates between 9-13 Democratic districts and is in agreement with the majority of the simulated results in 7 of the 11 elections. In 10 of the 11 elections the Enacted Plan is within the middle 50% of the simulation results.

2014 Senate	0%	4%	**60%**	35%	0%	0%	0%

Note: Each row shows the percent of simulations that produce the number of Democratic leaning districts using the election or election index indicated in the row. The bolded number in each row is the number of Democratic leaning districts produced by the Enacted Plan using the equivalent election. For example, using the 2020 Presidential election 100% of the simulations produce 13 Democratic leaning districts. The Enacted Plan does as well, as the '13 District' cell is bolded in that row.

6.27 Wake House County Grouping

The Wake House county group contains 13 districts. In the Enacted Map these are Districts 11, 21, 33, 34, 35, 36, 37, 38, 39, 40, 41, 49, and 66. The county cluster has an overall partisan index of .61, which is strongly Democratic. After conducting 50,000 initial simulations to create 13 districts in this cluster, I would normally discard any simulations that contain more county traversals than the Enacted Plan. However, this cluster is a single county, and thus, there are no traversals. Next, I discard any simulations in which the average compactness score of the districts in the simulations is not as large or larger than the compactness score of the Enacted Map. This leaves 14,305 simulated maps, each containing 13 districts.

A map of the location of this county cluster in relation to the rest of the state is shown in Figure 86. A map of the Enacted Map's district boundaries and the Duchin Map's district boundaries within this county grouping are shown in Figure 87.

The distribution of district partisanship based on the statewide partisan elections index calculated for each of the simulation results is shown in Figure 88. The black bars show the distribution from the simulation results, with the percentage of simulations that generate each of the various possible number of Democratic seats in the cluster shown below each bar. The red vertical line shows the number of Democratic leaning seats in the Enacted Map in the same cluster, and the vertical dashed green line shows the number of Democratic leaning seats in the Duchin Map in the cluster. In 2% of the simulations there are 10 Democratic leaning districts. In 32% of the simulations there are 11 Democratic leaning districts, and in 66% of the simulations there are 12 Democratic leaning districts. The Enacted Map creates 11 Democratic leaning districts. The Duchin Map generates 11 Democratic leaning districts as well.

Table 30 breaks apart the partisan index into the 11 constituent elections and shows the distribution of Democratic leaning seats generated if one were to look at each election separately. Each row shows the percent of simulations that produce the number of Demo-

cratic leaning districts using the election or election index indicated in the row. The bolded number in each row is the number of Democratic leaning districts produced by the Enacted Plan using the equivalent election. Across the 11 individual elections the Enacted Map generates between 9-13 Democratic districts and is in agreement with the majority of the simulated results in 7 of the 11 elections.

2014 Senate	0%	28%	**61%**	12%	0%	0%	0%

Note: Each row shows the percent of simulations that produce the number of Democratic leaning districts using the election or election index indicated in the row. The bolded number in each row is the number of Democratic leaning districts produced by the Enacted Plan using the equivalent election. For example, using the 2020 Presidential election 2% of the simulations produce 11 Democratic leaning districts. The Enacted Plan does as well, as the '11 District' cell is bolded in that row.

7 NC Senate Analysis

7.1 Senate Groupings with only 1 District

In the state Senate, there are 26 county clusters. 17 clusters containing 36 of the 50 districts are fixed based on the optimal county clusters determined by Cooper et al. (2021, 'Duke Study'). The remaining 9 clusters were selected by the General Assembly from four sets of choices between clusters as presented by the Duke Study.

In the Enacted Plan there are 14 county clusters composed of 48 counties in which the cluster contains only 1 Senate district. In these clusters there is no discretion for any map maker. The district is simply the boundaries of the county group. These counties collectively have a population of 2,906,456, or approximately 28% of the state's total population and account for 14 of the 50 seats in the state senate.

Figure 89 shows a map of the counties that constitute these single-district clusters in the Enacted Plan. Figure 90 shows a map of the countie that constitute these single-district clusters chosen in the Duchin Plan. Table 31 below shows each cluster, the counties included in the cluster, and the corresponding districts in the Senate Enacted Plan. The final two columns of the table show the partisan lean of the cluster using the 11 statewide partisan elections index discussed above and whether or not, based on that index, the cluster leans Democratic (or Republican). I classify a district (in the Enacted Plan and in the simulations as well) as being Democratic leaning if the partisan index for that district is greater than 0.50. In other words, if more than fifty percent of the ballots cast for the two major parties were for Democratic candidates, that district is classified as a Democratic leaning district. Obviously, districts with numbers much larger than (smaller than) 0.50 will be more likely to elect a Democrat (Republican) than districts that are very close to 0.50.

The bottom row of Table 31 shows the results for all 14 clusters together. Collectively these counties have a partisan index of 0.43, meaning roughly four in ten voters in these counties cast ballots for Democratic candidates in the 11 statewide races I consider here.

However, the location of voters for the different parties is not uniformly distributed across these counties. Given this spatial distribution of voters across the counties, 4 of the 14 clusters lean Democratic, or roughly 30 percent. In this case, the proportion of Democratic leaning districts is lower than the proportion of voters in these counties who favor Democratic candidates. However, this is not due to any district boundaries. It is again purely a function of the political geography of the state since all of these districts are entire county units and are, as such, fixed.

In some cases the Enacted Plan and the Duchin Plan use different county groupings from one another. This occurs in 4 cases and is shown in Table 31 below. This results in a net change of 3 counties included in single district groupings.[26]

In the Duchin Plan 5 of the 14 clusters lean Democratic, or approximately 36% of the districts. As in the Enacted Plan, the proportion of Democratic leaning districts is lower that the proportion of voters in these counties who favor Democratic candidates. However, this is not due to any district boundaries. It is again purely a function of the political geography of the state since all of these districts are entire county units and are, as such, fixed.

[26]Stokes replaces Yadkin, Henderson and Polk are replaced by McDowell and Cleveland.

Table 31: County Clusters Containing 1 Senate District

County Cluster	# Counties	District #	County Cluster Democratic Partisan Index	Democratic District

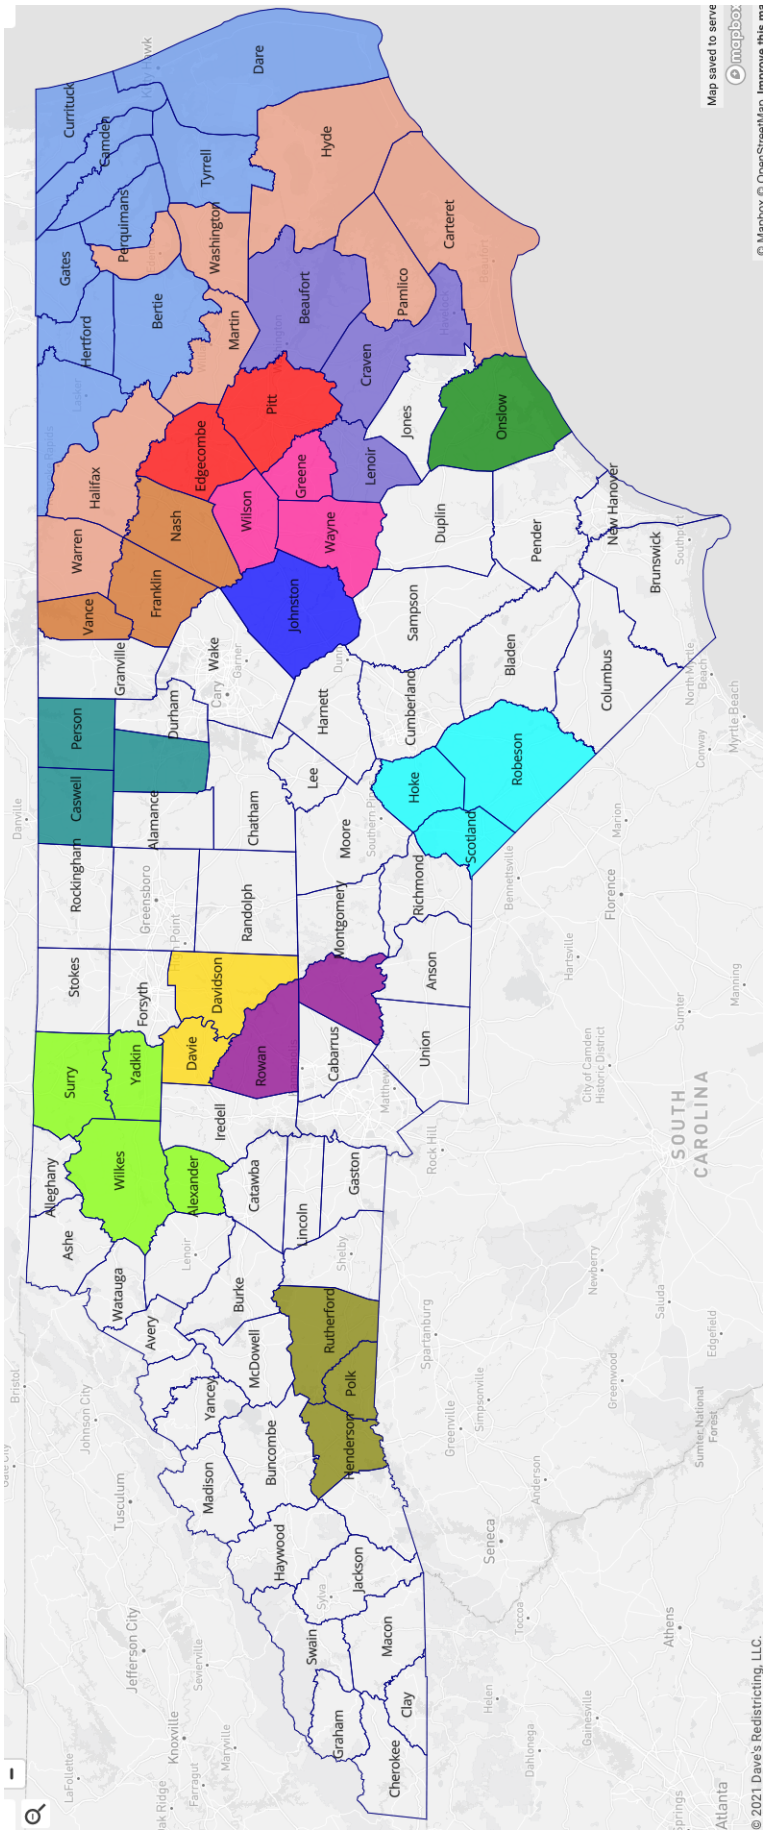
Figure 89: **Map of Counties and County Clusters with only 1 Senate District in Enacted Plan**



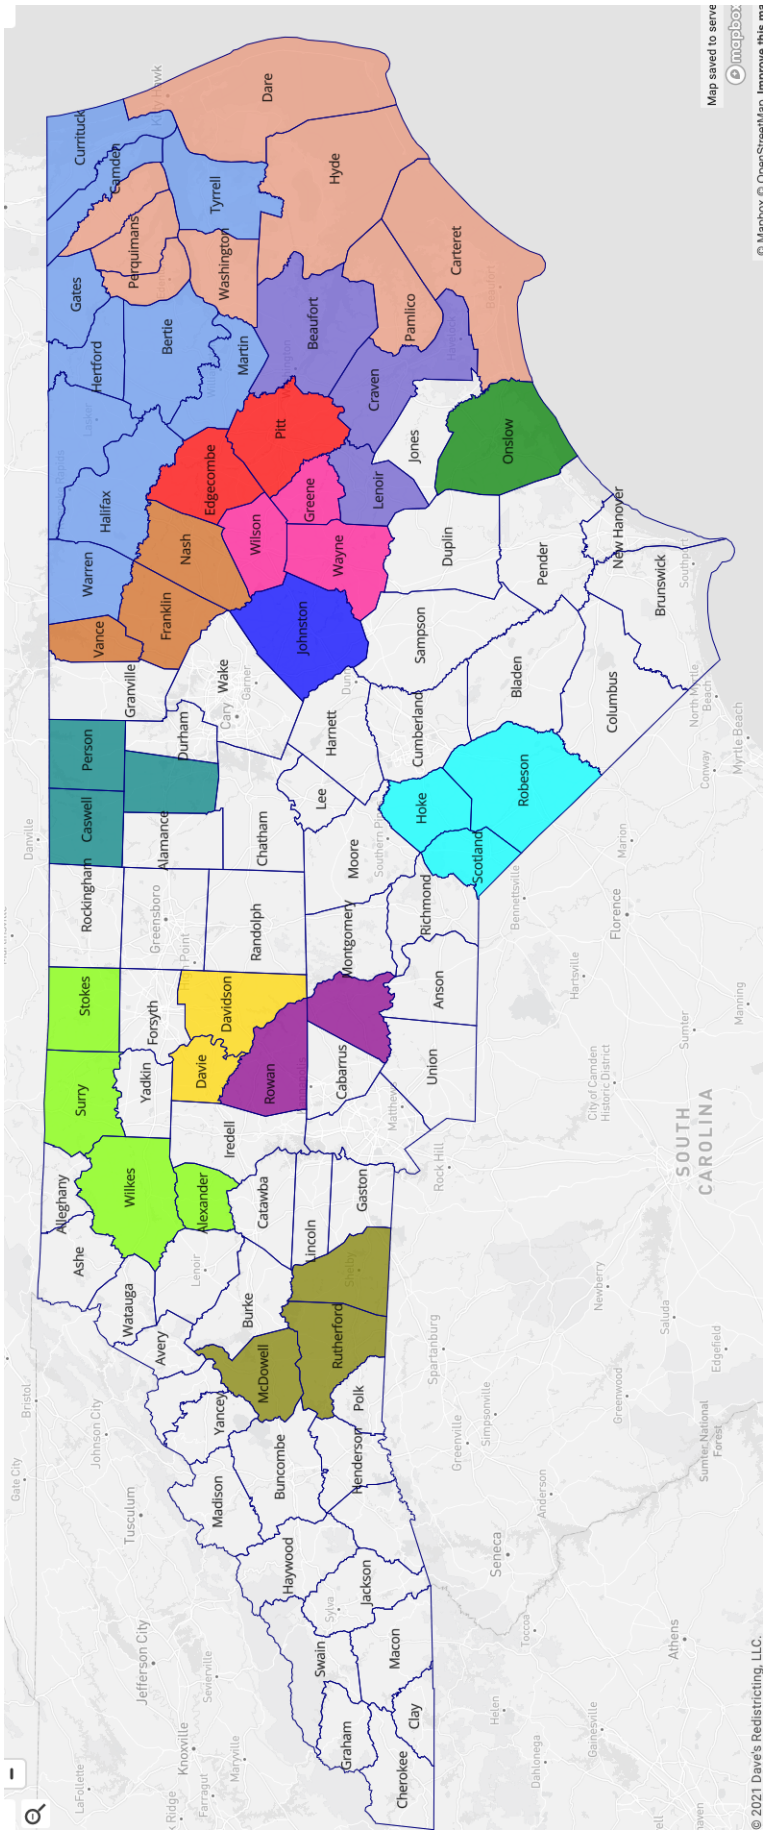


Figure 90: **Map of Counties and County Clusters with only 1 Senate District in Duchin Plan**

8 Senate Groupings with More than 1 District:

There are 12 county groups with more than 1 district where a map drawer has some discretion to draw districts. I consider each cluster separately because the districts are constrained to remain within the county cluster as the redistricting process is North Carolina is a series of discrete redistricting problems within each county cluster.

I conduct simulations in the 12 clusters that contain more than one Senate district. These clusters collectively account for 36 of the 50 districts in the North Carolina Senate. In the Enacted Plan, 20 of these districts lean Republican and 16 lean Democratic according to the statewide partisan elections index. In addition to calculating the number of Democratic leaning districts for the Enacted Plan, I also compute the same partisan index for the plaintiffs' Duchin Plan and compare how the Enacted Plan and the Duchin Plan perform on this same metric. The Duchin Plan creates 17 districts that lean Republican and 19 districts that lean Democratic according to the statewide partisan elections index in these districts.

I then place both maps in relation to the distribution of partisan outcomes from the simulated districts. In each cluster I consider the number of Democratic districts generated by each plan in comparison to the distribution of results from the simulations. I consider a plan to be a partisan outlier if the number of Democratic districts generated by the plan falls outside the middle 50% of simulation results. This is a conservative definition of an outlier. In the social sciences, medicine, and other disciplines it is traditional to consider something an outlier if it falls outside the middle 95% or 90% of the comparison distribution.

In the Senate, the Duchin Map chooses a different set of county clusters from those that have an alternative option presented in the Cooper et al. (2021, 'Duke Study') report. This occurs in three different county groupings. As a result, in these three different clusters the Duchin Senate Map and the Enacted Senate Map are not comparable because they use different groupings of counties. I compare the remaining nine clusters that are common between the two proposals. An overview of the results are as follows.

In 10 of the 12 clusters, the Enacted Map produces a number of Democratic districts

that falls within the middle 50% of simulation results and are not partisan outliers. Furthermore, the Enacted Map produces the same number of Democratic leaning districts as the modal (most common) number of Democratic leaning districts in the simulations in 10 of the 12 clusters.

In 10 of the 12 clusters, the Duchin Map produces a number of Democratic districts that fall within the middle 50% of simulation results and are not partisan outliers. Furthermore, the Duchin Map produces the same number of Democratic leaning districts as the modal (most common) number of Democratic leaning districts in the simulations in 10 of the 12 clusters.

In 6 of the 9 clusters that are common between the Enacted Map and the Duchin Map there is agreement between the two plans on the number of Democratic leaning districts.[27] This means there is disagreement in 4 of the 26 total clusters. Table 32 summarizes the results of the simulation analysis for the 12 Senate clusters with multiple districts. Figure 91 shows a map of the counties where the Enacted Plan and the Duchin Plan are in agreement on the number of Democratic leaning seats. Figure 92 shows a map of the counties where the Enacted Plan and the Duchin Plan disagree on the number of Democratic leaning seats.

Thereafter, I present the results cluster-by-cluster.

[27]These groupings are: Cumberland-Moore, Chatham-Durham, Alleghany et al., Brunswick-Columbus-New Hanover, Bladen et al., Alamance et al., and the combination of Buncombe, Burke, McDowell, Cleveland, Gaston, Lincoln, Henderson, Polk, Forsyth, Stokes, and Yadkin into four different groupings.

Table 32: Senate County Grouping Analysis Summary

Cleveland-Gaston-Lincoln	0.34	2	0		0
Forsyth-Stokes	0.52	2	1		1
Alternative Clusters Used by Duchin Plan					
Buncombe-Henderson-Polk	0.54	2		1	1
Burke-Gaston-Lincoln	0.34	2		0	0
Forsyth-Yadkin	0.54	2		1	1
Total:		35	16	19	19

Note: Number of Democratic leaning districts is measured using the average two-party vote share in each district from the 11 statewide races noted earlier. Simulations range represents the middle 50% of outcomes from the simulations results. Clusters that fall outside of the simulation range are bolded.

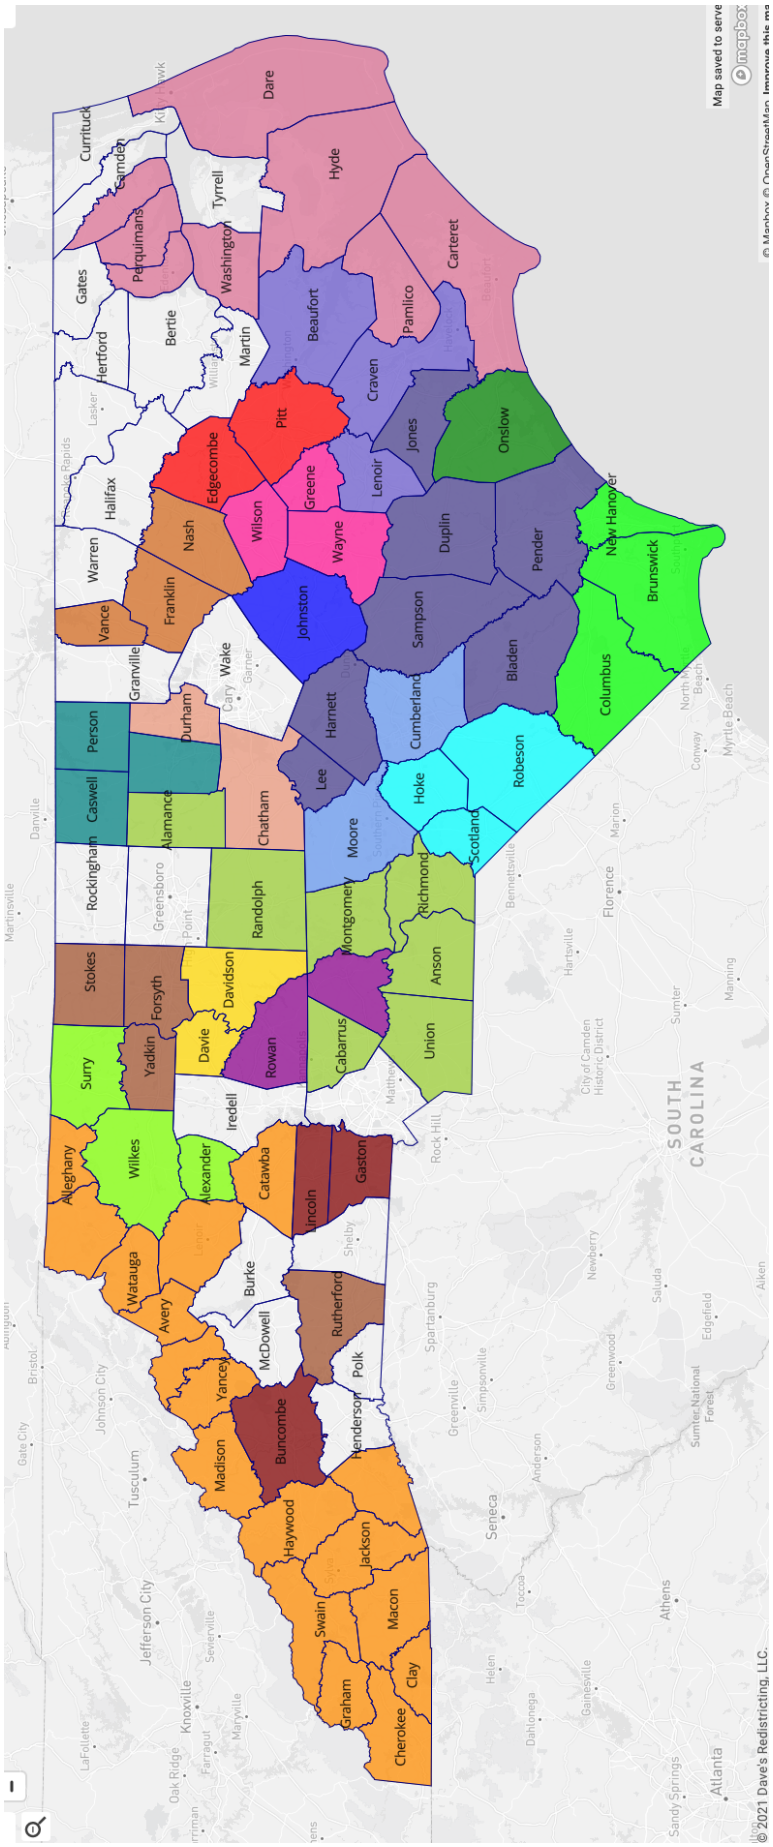

Figure 91: **Map of Senate Counties Where Enacted and Duchin Plans Agree on Partisan Lean of Districts**

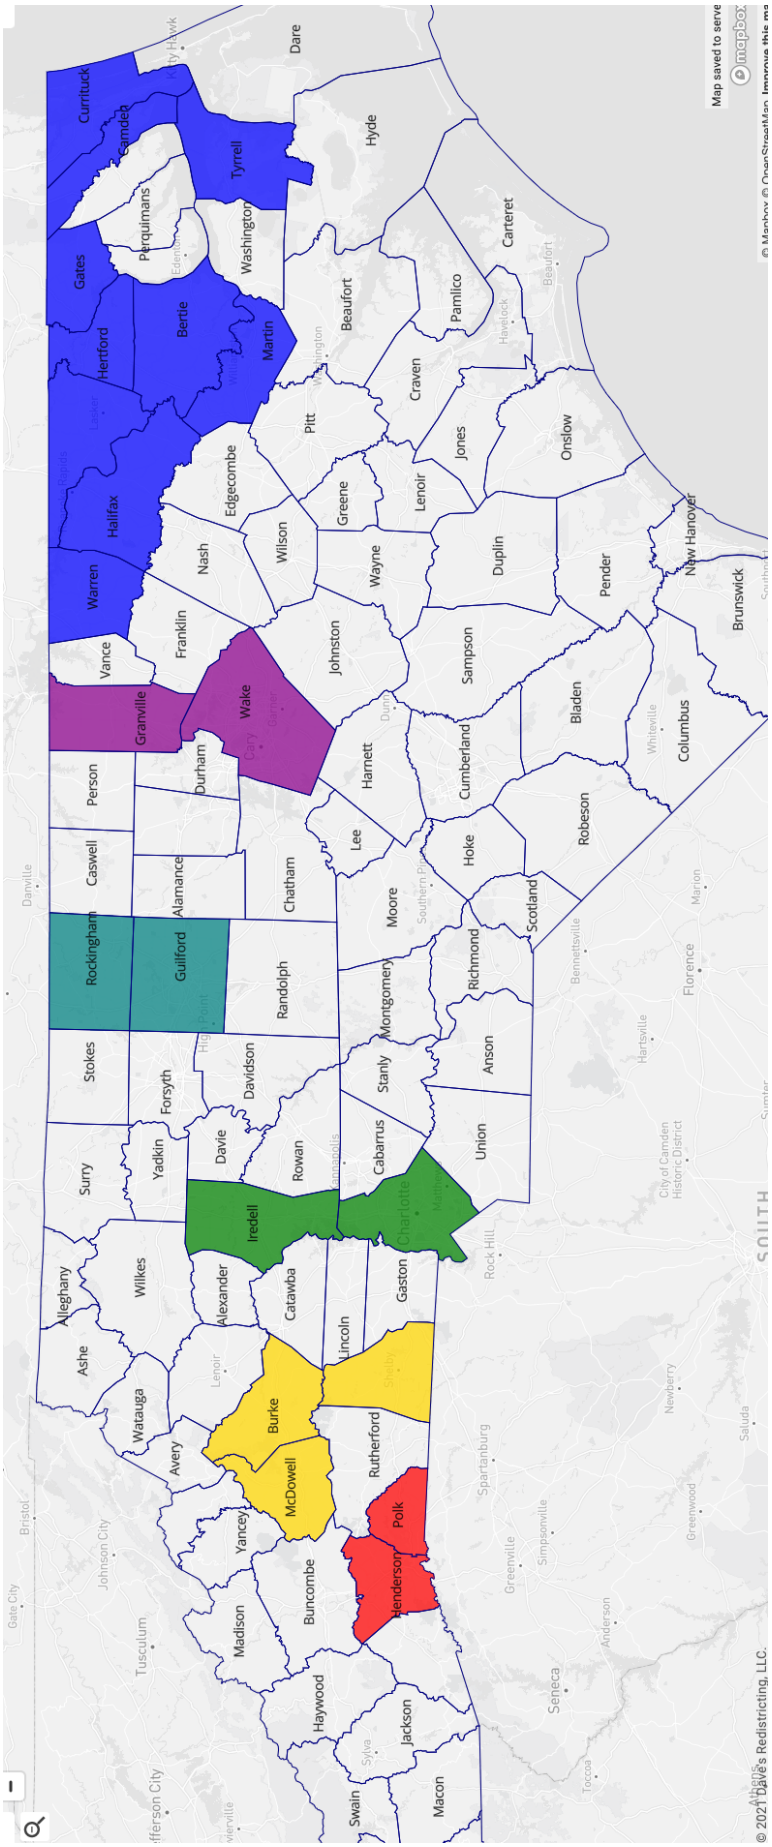

Figure 92: **Map of Senate Counties Where Enacted and Duchin Plans Disagree on Partisan Lean of Districts**

8.1 Cumberland and Moore Senate County Grouping

The Cumberland-Moore Senate county group contains 2 districts. In the Enacted Map these are Districts 19 and 21. The county cluster has an overall partisan index of .52, which is slightly Democratic. After conducting 50,000 initial simulations to create two districts in this cluster, I discard any simulations that contain more county traversals than the Enacted Plan. All 50,000 simulations meet this criteria. Next, I discard any simulations in which the average compactness score of the districts in the simulations is not as large or larger than the compactness score of the Enacted Map. This leaves 42,625 simulated maps, each containing two districts.

A map of the location of this county cluster in relation to the rest of the state is shown in Figure 93. A map of the Enacted Map's district boundaries and the Duchin Map's district boundaries within this county grouping are shown in Figure 94.

The distribution of district partisanship based on the statewide partisan elections index calculated for each of the simulation results is shown in Figure 95. The black bars show the distribution from the simulation results, with the percentage of simulations that generate each of the various possible number of Democratic seats in the cluster shown below each bar. The red vertical line shows the number of Democratic leaning seats in the Enacted Map in the same cluster, and the vertical dashed green line shows the number of Democratic leaning seats in the Duchin Map in the cluster. In 77% of the simulations there is 1 Democratic leaning district. The Enacted Map is in alignment with the modal outcome of the simulations by also creating 1 Democratic district. The Duchin Map also generates 1 Democratic district.

Table 33 breaks apart the partisan index into the 11 constituent elections and shows the distribution of Democratic leaning seats generated if one were to look at each election separately. Each row shows the percent of simulations that produce the number of Democratic leaning districts using the election or election index indicated in the row. The bolded number in each row is the number of Democratic leaning districts produced by the Enacted Plan using the equivalent election. In 10 of the 11 individual elections there is agreement

between the modal outcome in the simulations and the Enacted Map.

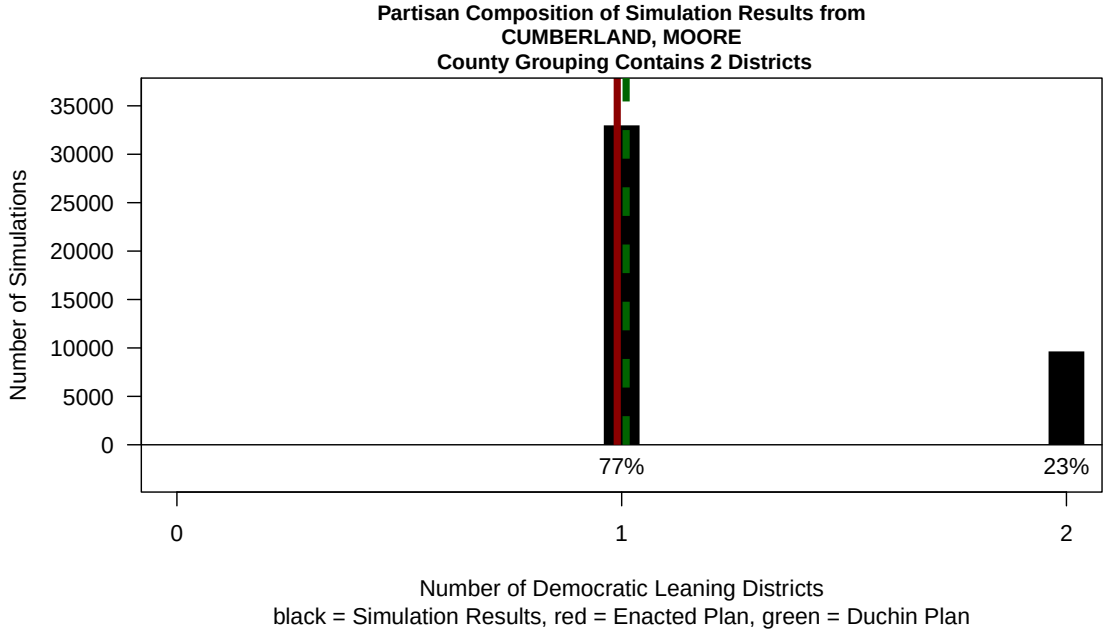
(b) Duchin Map



Partisan Lean of Districts

District:	Enacted Plan	Duchin Plan
19	0.66	0.66
25 (21 in Duchin)	0.40	0.40

Note: Partisan index is based on the two-party vote average of 11 statewide partisan elections between 2014-2020.

Figure 95: **Distribution of Partisan Districts from Simulations in Cumberland and Moore Senate County Cluster**

Note: Distribution of likely district partisanship based on the statewide partisan elections index calculated for each of the simulation results. The black bars show the distribution from the simulation results, with the percentage of simulations that generate each of the various possible number of Democratic seats in the cluster shown below each bar. The red vertical line shows the number of Democratic leaning seats in the Enacted Map in the same cluster, and the vertical dashed green line shows the number of Democratic leaning seats in the Duchin Map in the cluster.

Table 33: Simulation Results by Individual Elections

Cumberland and Moore Senate County Cluster

Number of Democratic Leaning Districts:			
	0	1	2
Individual Elections:			
2020 President	0%	**82%**	18%
2020 Senate	0%	**91%**	9%
2020 Governor	0%	**7%**	93%
2020 Lt. Governor	0%	**94%**	6%
2020 Attorney General	0%	**58%**	42%
2016 President	0%	**84%**	16%
2016 Senate	0%	**97%**	3%
2016 Governor	0%	**71%**	29%
2016 Lt. Governor	0%	**99%**	1%
2016 Attorney General	0%	**57%**	43%
2014 Senate	0%	**96%**	4%

Note: Each row shows the percent of simulations that produce the number of Democratic leaning districts using the election or election index indicated in the row. The bolded number in each row is the number of Democratic leaning districts produced by the Enacted Plan using the equivalent election. For example, using the 2020 Presidential election 82% of the simulations produce 1 Democratic leaning district. The Enacted Plan does as well, as the '1 District' cell is bolded in that row.

8.2 Chatham and Durham Senate County Grouping

The Chatham-Durham Senate county group contains 2 districts. In the Enacted Map these are Districts 20 and 22. The county cluster has an overall partisan index of .75, which is strongly Democratic. After conducting 50,000 initial simulations to create two districts in this cluster, I discard any simulations that contain more county traversals than the Enacted Plan. This leaves 49,721 simulations that meet this criteria. Next, I discard any simulations in which the average compactness score of the districts in the simulations is not as large or larger than the compactness score of the Enacted Map. This leaves 1,750 simulated maps, each containing two districts.

A map of the location of this county cluster in relation to the rest of the state is shown in Figure 96. A map of the Enacted Map's district boundaries and the Duchin Map's district boundaries within this county grouping are shown in Figure 97.

The distribution of district partisanship based on the statewide partisan elections index calculated for each of the simulation results is shown in Figure 98. The black bars show the distribution from the simulation results, with the percentage of simulations that generate each of the various possible number of Democratic seats in the cluster shown below each bar. The red vertical line shows the number of Democratic leaning seats in the Enacted Map in the same cluster, and the vertical dashed green line shows the number of Democratic leaning seats in the Duchin Map in the cluster. In 100% of the simulations there are 2 Democratic leaning districts. The Enacted Map is in alignment with the modal outcome of the simulations by also creating 2 Democratic leaning districts. The Duchin Map also generates 2 Democratic leaning districts.

Table 34 breaks apart the partisan index into the 11 constituent elections and shows the distribution of Democratic leaning seats generated if one were to look at each election separately. Each row shows the percent of simulations that produce the number of Democratic leaning districts using the election or election index indicated in the row. The bolded number in each row is the number of Democratic leaning districts produced by the Enacted

Plan using the equivalent election. In all 11 of the 11 individual elections there is agreement between the modal outcome in the simulations and the Enacted Map.

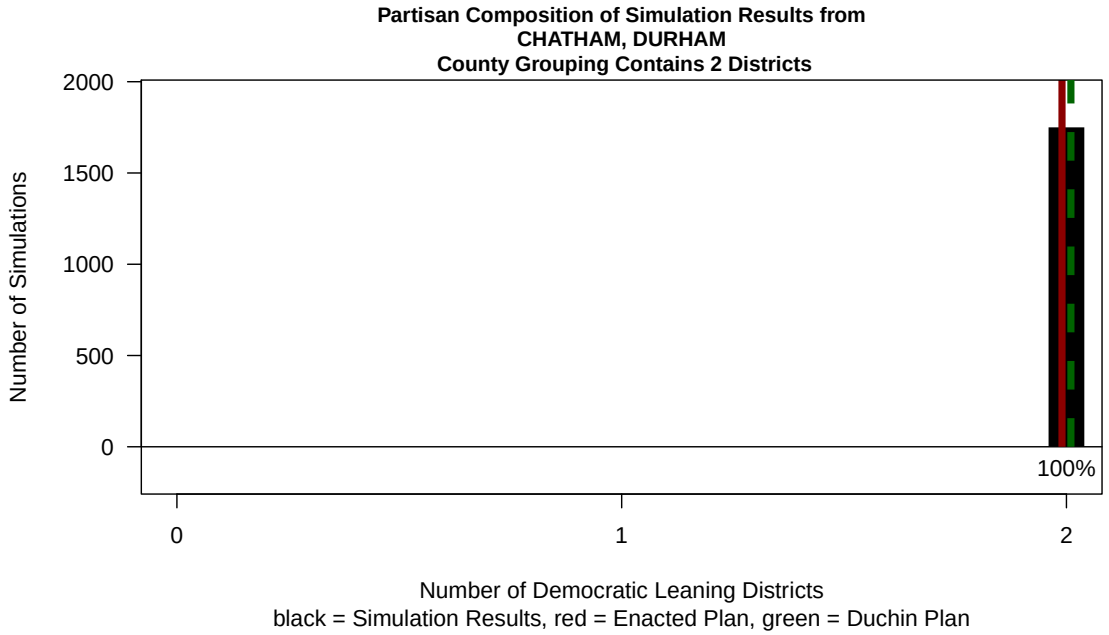
(b) Duchin Map



Partisan Lean of Districts

District:	Enacted Plan	Duchin Plan
20 (23 in Duchin)	0.72	0.71
22 (20 in Duchin)	0.79	0.79

Note: Partisan index is based on the two-party vote average of 11 statewide partisan elections between 2014-2020.

Figure 98: **Distribution of Partisan Districts from Simulations in Chatham and Durham Senate County Cluster**

Note: Distribution of likely district partisanship based on the statewide partisan elections index calculated for each of the simulation results. The black bars show the distribution from the simulation results, with the percentage of simulations that generate each of the various possible number of Democratic seats in the cluster shown below each bar. The red vertical line shows the number of Democratic leaning seats in the Enacted Map in the same cluster, and the vertical dashed green line shows the number of Democratic leaning seats in the Duchin Map in the cluster.

Table 34: Simulation Results by Individual Elections

Chatham and Durham Senate County Cluster

Number of Democratic Leaning Districts:			
	0	1	2
Individual Elections:			
2020 President	0%	0%	**100%**
2020 Senate	0%	0%	**100%**
2020 Governor	0%	0%	**100%**
2020 Lt. Governor	0%	0%	**100%**
2020 Attorney General	0%	0%	**100%**
2016 President	0%	0%	**100%**
2016 Senate	0%	0%	**100%**
2016 Governor	0%	0%	**100%**
2016 Lt. Governor	0%	0%	**100%**
2016 Attorney General	0%	0%	**100%**
2014 Senate	0%	0%	**100%**

Note: Each row shows the percent of simulations that produce the number of Democratic leaning districts using the election or election index indicated in the row. The bolded number in each row is the number of Democratic leaning districts produced by the Enacted Plan using the equivalent election. For example, using the 2020 Presidential election 100% of the simulations produce 2 Democratic leaning districts. The Enacted Plan does as well, as the '2 Districts' cell is bolded in that row.

8.3 Bladen, Duplin, Harnett, Jones, Lee, Pender, and Sampson Senate County Grouping

The Bladen-Duplin-Harnett-Jones-Lee-Pender-Sampson Senate county grouping contains 2 districts. In the Enacted Map these are Districts 9 and 12. The county cluster has an overall partisan index of 0.41, which is strongly Republican. After conducting 50,000 initial simulations to create two districts in this cluster, I discard any simulations that contain more county traversals than the Enacted Plan. All 50,000 simulated maps meet this criteria. Next, I discard any simulations in which the average compactness score of the districts in the simulations is not as large or larger than the compactness score of the Enacted Map. This leaves only one unique map that is as compact as the Enacted Plan.

A map of the location of this county cluster in relation to the rest of the state is shown in Figure 99. A map of the Enacted Map's district boundaries and the Duchin Map's district boundaries within this county grouping are shown in Figure 100.

Because there is only 1 map that fits the criteria I use of equal population, county traversals, and compactness equal to or better than the Enacted Map, I do not present the distribution of district partisanship for the simulations here. It is sufficient to say that in the Enacted Map, the Duchin map, and the remaining simulated map all create 2 Republican districts and 0 Democratic leaning districts, regardless of the index or election used. Table 35 shows this below.

Figure 99: **Map of Bladen, Duplin, Harnett, Jones, Lee, Pender, and Sampson Senate County Cluster**

(b) Duchin Map

Partisan Lean of Districts

District:	Enacted Plan	Duchin Plan
9 (10 in Duchin)	0.40	0.41
12	0.41	0.41

Note: Partisan index is based on the two-party vote average of 11 statewide partisan elections between 2014-2020.

Table 35: Simulation Results by Individual Elections

Bladen, Duplin, Harnett, Jones, Lee, Pender, and Sampson Senate County Cluster

Number of Democratic Leaning Districts:			
	0	1	2
Individual Elections:			
2020 President	**100%**	0%	0%
2020 Senate	**100%**	0%	0%
2020 Governor	**100%**	0%	0%
2020 Lt. Governor	**100%**	0%	0%
2020 Attorney General	**100%**	0%	0%
2016 President	**100%**	0%	0%
2016 Senate	**100%**	0%	0%
2016 Governor	**100%**	0%	0%
2016 Lt. Governor	**100%**	0%	0%
2016 Attorney General	**100%**	0%	0%
2014 Senate	**100%**	0%	0%

Note: Each row shows the percent of simulations that produce the number of Democratic leaning districts using the election or election index indicated in the row. The bolded number in each row is the number of Democratic leaning districts produced by the Enacted Plan using the equivalent election. For example, using the 2020 Presidential election 100% of the simulations produce 0 Democratic leaning districts. The Enacted Plan does as well, as the '0 District' cell is bolded in that row.

8.4 Brunswick, Columbus, and New Hanover Senate County Grouping

The Brunswick-Columbus-New Hanover Senate county group contains 2 districts. In the Enacted Map these are Districts 7 and 8. The county cluster has an overall partisan index of .45, which is Republican leaning. After conducting 50,000 initial simulations to create two districts in this cluster, I discard any simulations that contain more county traversals than the Enacted Plan. This leaves 31,037 simulations that meet this criteria. Next, I discard any simulations in which the average compactness score of the districts in the simulations is not as large or larger than the compactness score of the Enacted Map. This leaves 30,499 simulated maps, each containing two districts.

A map of the location of this county cluster in relation to the rest of the state is shown in Figure 101. A map of the Enacted Map's district boundaries and the Duchin Map's district boundaries within this county grouping are shown in Figure 102.

The distribution of district partisanship based on the statewide partisan elections index calculated for each of the simulation results is shown in Figure 103. The black bars show the distribution from the simulation results, with the percentage of simulations that generate each of the various possible number of Democratic seats in the cluster shown below each bar. The red vertical line shows the number of Democratic leaning seats in the Enacted Map in the same cluster, and the vertical dashed green line shows the number of Democratic leaning seats in the Duchin Map in the cluster. In 77% of the simulations there is 1 Democratic leaning districts. The Enacted Map is in alignment with the modal outcome of the simulations by also creating 1 Democratic leaning district. The Duchin Map also generates 1 Democratic leaning district.

Table 36 breaks apart the partisan index into the 11 constituent elections and shows the distribution of Democratic leaning seats generated if one were to look at each election separately. Each row shows the percent of simulations that produce the number of Democratic leaning districts using the election or election index indicated in the row. The bolded

number in each row is the number of Democratic leaning districts produced by the Enacted Plan using the equivalent election. In 9 of the 11 individual elections there is agreement between the modal outcome in the simulations and the Enacted Map. In all 11 of the 11 individual elections the Enacted Plan falls within the middle 50% of the simulation results.

2016 Governor	3%	**97%**	0%
2016 Lt. Governor	**100%**	0%	0%
2016 Attorney General	16%	**84%**	0%
2014 Senate	**26%**	74%	0%

Note: Each row shows the percent of simulations that produce the number of Democratic leaning districts using the election or election index indicated in the row. The bolded number in each row is the number of Democratic leaning districts produced by the Enacted Plan using the equivalent election. For example, using the 2020 Presidential election 87% of the simulations produce 1 Democratic leaning district. The Enacted Plan does as well, as the '1 District' cell is bolded in that row.

8.5 Alleghany, Ashe, Avery, Caldwell, Catawba, Cherokee, Clay, Graham, Haywood, Jackson, Macon, Madison, Mitchell, Swain, Transylvania, Watauga, and Yancey Senate County Grouping

The Alleghany-et al. Senate county group contains 3 districts. In the Enacted Map these are Districts 47, 45, and 50. The county cluster has an overall partisan index of .35, which is strongly Republican. After conducting 50,000 initial simulations to create three districts in this cluster, I discard any simulations that contain more county traversals than the Enacted Plan. This leaves 37,454 simulations that meet this criteria. Next, I discard any simulations in which the average compactness score of the districts in the simulations is not as large or larger than the compactness score of the Enacted Map. This leaves 22,065 simulated maps, each containing three districts.

A map of the location of this county cluster in relation to the rest of the state is shown in Figure 104. A map of the Enacted Map's district boundaries and the Duchin Map's district boundaries within this county grouping are shown in Figure 105.

The distribution of district partisanship based on the statewide partisan elections index calculated for each of the simulation results is shown in Figure 106. The black bars show the distribution from the simulation results, with the percentage of simulations that generate each of the various possible number of Democratic seats in the cluster shown below each bar. The red vertical line shows the number of Democratic leaning seats in the Enacted Map in the same cluster, and the vertical dashed green line shows the number of Democratic leaning seats in the Duchin Map in the cluster. In 100% of the simulations there are 0 Democratic leaning districts. The Enacted Map is in alignment with the modal outcome of the simulations by also creating 0 Democratic leaning districts. The Duchin Map also generates 0 Democratic leaning districts.

Table 37 breaks apart the partisan index into the 11 constituent elections and shows the distribution of Democratic leaning seats generated if one were to look at each election

separately. Each row shows the percent of simulations that produce the number of Democratic leaning districts using the election or election index indicated in the row. The bolded number in each row is the number of Democratic leaning districts produced by the Enacted Plan using the equivalent election. In all 11 of the 11 individual elections there is agreement between the modal outcome in the simulations and the Enacted Map.

The black bars show the distribution from the simulation results, with the percentage of simulations that generate each of the various possible number of Democratic seats in the cluster shown below each bar. The red vertical line shows the number of Democratic leaning seats in the Enacted Map in the same cluster, and the vertical dashed green line shows the number of Democratic leaning seats in the Duchin Map in the cluster.

Table 37: Simulation Results by Individual Elections

Alleghany, Ashe, Avery, Caldwell, Catawba, Cherokee, Clay, Graham, Haywood, Jackson, Macon, Madison, Mitchell, Swain, Transylvania, Watauga, and Yancey Senate County Cluster

	Percentage of Simulations			
Number of Democratic Leaning Districts:	0	1	2	3
Individual Elections:				
2020 President	**100%**	0%	0%	0%
2020 Senate	**100%**	0%	0%	0%
2020 Governor	**100%**	0%	0%	0%
2020 Lt. Governor	**100%**	0%	0%	0%
2020 Attorney General	**100%**	0%	0%	0%
2016 President	**100%**	0%	0%	0%
2016 Senate	**100%**	0%	0%	0%
2016 Governor	**100%**	0%	0%	0%
2016 Lt. Governor	**100%**	0%	0%	0%
2016 Attorney General	**100%**	0%	0%	0%
2014 Senate	**100%**	0%	0%	0%

Note: Each row shows the percent of simulations that produce the number of Democratic leaning districts using the election or election index indicated in the row. The bolded number in each row is the number of Democratic leaning districts produced by the Enacted Plan using the equivalent election. For example, using the 2020 Presidential election 100% of the simulations produce 0 Democratic leaning districts. The Enacted Plan does as well, as the '0 Districts' cell is bolded in that row.

8.6 Guilford and Rockingham Senate County Grouping

The Guilford-Rockingham Senate county group contains 3 districts. In the Enacted Map these are Districts 26, 27, and 28. The county cluster has an overall partisan index of .57, which is solidly Democratic. After conducting 50,000 initial simulations to create three districts in this cluster, I discard any simulations that contain more county traversals than the Enacted Plan. This leaves 37,148 simulations that meet this criteria. Next, I discard any simulations in which the average compactness score of the districts in the simulations is not as large or larger than the compactness score of the Enacted Map. This leaves 24,667 simulated maps, each containing three districts.

A map of the location of this county cluster in relation to the rest of the state is shown in Figure 107. A map of the Enacted Map's district boundaries and the Duchin Map's district boundaries within this county grouping are shown in Figure 108.

The distribution of district partisanship based on the statewide partisan elections index calculated for each of the simulation results is shown in Figure 110. The black bars show the distribution from the simulation results, with the percentage of simulations that generate each of the various possible number of Democratic seats in the cluster shown below each bar. The red vertical line shows the number of Democratic leaning seats in the Enacted Map in the same cluster, and the vertical dashed green line shows the number of Democratic leaning seats in the Duchin Map in the cluster. In 94% of the simulations there are 2 Democratic leaning districts. The Enacted Map is in alignment with the modal outcome of the simulations by also creating 2 Democratic leaning districts. The Duchin Map generates 3 Democratic leaning districts, which only occurs in 6% of the simulations. This is outside the middle 50% of simulations and is a partisan outlier.

Table 39 breaks apart the partisan index into the 11 constituent elections and shows the distribution of Democratic leaning seats generated if one were to look at each election separately. Each row shows the percent of simulations that produce the number of Democratic leaning districts using the election or election index indicated in the row. The bolded

number in each row is the number of Democratic leaning districts produced by the Enacted Plan using the equivalent election. In all 11 of the 11 individual elections there is agreement between the modal (most common) outcome in the simulations and the Enacted Map.

The Duchin Plan creates three Democratic leaning district by dividing the city of Greensboro, the county seat and largest city in Guilford County, into three relatively equal pieces. The Enacted Plan does not and instead keeps the vast majority of Greensboro in two districts. Most of the Democratic leaning voting in this cluster reside in Greensboro. This "pie" division of Greensboro by the Duchin Plan therefore spread Democratic voters more equally across the three districts. However, it comes at the expense of dividing a city into more districts than necessary. Table 38 shows the division of Greensboro residents across the districts in the two plans. Figure 109 shows a map of the divisions.

Table 38: Division of Greensboro in Enacted Plan and Duchin Plan

	Percent of Greensboro in district	
District:	Enacted Plan	Duchin Plan
26 (30 in Duchin)	4.3	19.6
27	30.8	20.4
28	64.9	60.0
Total:	100%	100%

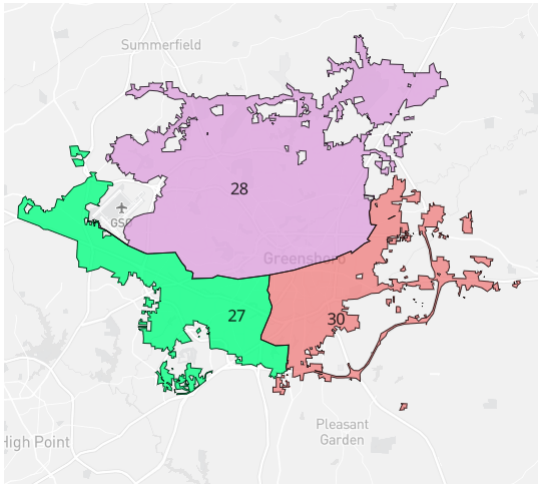

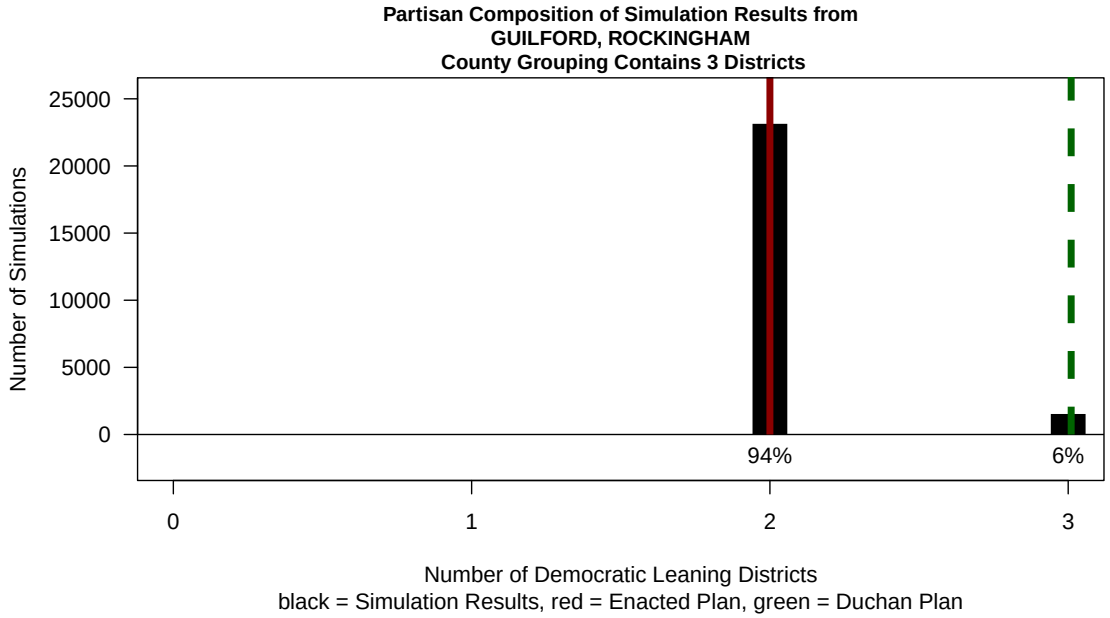

Figure 110: **Distribution of Partisan Districts from Simulations in Guilford and Rockingham Senate County Cluster**

Note: Distribution of likely district partisanship based on the statewide partisan elections index calculated for each of the simulation results. The black bars show the distribution from the simulation results, with the percentage of simulations that generate each of the various possible number of Democratic seats in the cluster shown below each bar. The red vertical line shows the number of Democratic leaning seats in the Enacted Map in the same cluster, and the vertical dashed green line shows the number of Democratic leaning seats in the Duchin Map in the cluster.

Table 39: Simulation Results by Individual Elections

Guilford and Rockingham County Cluster

Number of Democratic Leaning Districts:				
	0	1	2	3
Individual Elections:				
2020 President	0%	0%	**95%**	5%
2020 Senate	0%	0%	**94%**	6%
2020 Governor	0%	0%	**57%**	43%
2020 Lt. Governor	0%	0%	**96%**	4%
2020 Attorney General	0%	0%	**93%**	7%
2016 President	0%	0%	**96%**	4%
2016 Senate	0%	1%	**96%**	3%
2016 Governor	0%	0%	**83%**	17%
2016 Lt. Governor	0%	1%	**96%**	3%
2016 Attorney General	0%	0%	**91%**	9%
2014 Senate	0%	1%	**94%**	5%

Note: Each row shows the percent of simulations that produce the number of Democratic leaning districts using the election or election index indicated in the row. The bolded number in each row is the number of Democratic leaning districts produced by the Enacted Plan using the equivalent election. For example, using the 2020 Presidential election 95% of the simulations produce 2 Democratic leaning districts. The Enacted Plan does as well, as the '2 Districts' cell is bolded in that row.

8.7 Alamance, Anson, Cabarrus, Montgomery, Randolph, Richmond, and Union Senate County Grouping

The Alamance-Anson-Cabarrus-Montgomery-Randolph-Richmond-Union Senate county group contains 4 districts. In the Enacted Map these are Districts 25, 29, 34, and 35. The county cluster has an overall partisan index of .38, which is solidly Republican. After conducting 50,000 initial simulations to create four districts in this cluster, I discard any simulations that contain more county traversals than the Enacted Plan. This leaves 35,298 simulations that meet this criteria. Next, I discard any simulations in which the average compactness score of the districts in the simulations is not as large or larger than the compactness score of the Enacted Map. This leaves 25,747 simulated maps, each containing four districts.

A map of the location of this county cluster in relation to the rest of the state is shown in Figure 111. A map of the Enacted Map's district boundaries and the Duchin Map's district boundaries within this county grouping are shown in Figure 112.

The distribution of district partisanship based on the statewide partisan elections index calculated for each of the simulation results is shown in Figure 113. The black bars show the distribution from the simulation results, with the percentage of simulations that generate each of the various possible number of Democratic seats in the cluster shown below each bar. The red vertical line shows the number of Democratic leaning seats in the Enacted Map in the same cluster, and the vertical dashed green line shows the number of Democratic leaning seats in the Duchin Map in the cluster. In 100% of the simulations there are 0 Democratic leaning districts. The Enacted Map is in alignment with the modal outcome of the simulations by also creating 0 Democratic leaning districts. The Duchin Map also generates 0 Democratic leaning districts.

Table 40 breaks apart the partisan index into the 11 constituent elections and shows the distribution of Democratic leaning seats generated if one were to look at each election separately. Each row shows the percent of simulations that produce the number of Demo-

cratic leaning districts using the election or election index indicated in the row. The bolded number in each row is the number of Democratic leaning districts produced by the Enacted Plan using the equivalent election. In all 11 of the 11 individual elections there is agreement between the modal (most common) outcome in the simulations and the Enacted Map.

2016 Attorney General	**100%**	0%	0%	0%	0%
2014 Senate	**100%**	0%	0%	0%	0%

Note: Each row shows the percent of simulations that produce the number of Democratic leaning districts using the election or election index indicated in the row. The bolded number in each row is the number of Democratic leaning districts produced by the Enacted Plan using the equivalent election. For example, using the 2020 Presidential election 100% of the simulations produce 0 Democratic leaning districts. The Enacted Plan does as well, as the '0 Districts' cell is bolded in that row.

8.8 Granville and Wake Senate County Grouping

The Granville-Wake Senate county group contains 6 districts. In the Enacted Map these are Districts 13, 14, 15, 16, 17, and 18. The county cluster has an overall partisan index of .61, which is solidly Democratic. After conducting 50,000 initial simulations to create six districts in this cluster, I discard any simulations that contain more county traversals than the Enacted Plan. This leaves 45,850 simulations that meet this criteria. Next, I discard any simulations in which the average compactness score of the districts in the simulations is not as large or larger than the compactness score of the Enacted Map. This leaves 2,835 simulated maps, each containing six districts.

A map of the location of this county cluster in relation to the rest of the state is shown in Figure 114. A map of the Enacted Map's district boundaries and the Duchin Map's district boundaries within this county grouping are shown in Figure 115.

The distribution of district partisanship based on the statewide partisan elections index calculated for each of the simulation results is shown in Figure 117. The black bars show the distribution from the simulation results, with the percentage of simulations that generate each of the various possible number of Democratic seats in the cluster shown below each bar. The red vertical line shows the number of Democratic leaning seats in the Enacted Map in the same cluster, and the vertical dashed green line shows the number of Democratic leaning seats in the Duchin Map in the cluster. In 1% of the simulations there are 4 Democratic leaning districts. In 24% of the simulations there are 5 Democratic leaning districts, and in 75% of the simulations there are 6 Democratic leaning districts. The Enacted Map generates 4 Democratic leaning districts, which is an outlier from middle 50% of the simulations. The Duchin Map generates 5 Democratic leaning districts and is also classified as a partisan outlier.

Table 42 breaks apart the partisan index into the 11 constituent elections and shows the distribution of Democratic leaning seats generated if one were to look at each election separately. Each row shows the percent of simulations that produce the number of Demo-

cratic leaning districts using the election or election index indicated in the row. The bolded number in each row is the number of Democratic leaning districts produced by the Enacted Plan using the equivalent election. In 10 of the 11 individual elections the Enacted Plan is not in alignment with the middle 50% of the simulation results and is therefore classified as an outlier.

Why is the Enacted Plan such an outlier in this county grouping? There are two factors to consider in explaining this divergence. First, while the Enacted Plan generates 4 solidly Democratic leaning districts, the remaining two districts are not solidly Republican. Instead, they would be best classified as highly competitive. District 13 has a partisan index of 0.481 and District 17 has a partisan index of 0.489. These two districts will likely be very closely decided with candidates from both parties winning them with some regularity, given their narrow margins. This is actually quite close to the partisan lean of the Duchin Plan. While the Duchin Plan creates 5 Democratic leaning districts in the county group, there are also two very competitive districts (District 22 - partisan index of 0.499 and District 17 - partisan index of 0.505). It just happens that one of the competitive districts is just over the .50 line and is classified as Democratic leaning. Thus, both plans generate 4 solidly Democratic districts and 2 highly competitive districts. The Duchin Plan's competitive districts are just slightly more Democratic by roughly 1.7 percentage points.

The second factor to consider is that the Enacted Plan divides the city of Raleigh and groups other municipalities differently from the Duchin Plan, which has the impact of placing a greater share of its residents in fewer districts. For example, District 13 keeps the cities of Wake Forest, Rolesville, and Zebulon together in one district. Additionally, the Enacted Plan places more of Raleigh into fewer districts. This is ideal if one is trying to keep municipalities together and spread across as few districts as possible. However, because the bulk of Democratic leaning voters in this county cluster are also in the city of Raleigh, this will have the effect of creating districts that are more heavily Democratic. This, of course, has the spillover effect of making the districts that do not contain portions of Raleigh to

likewise become more Republican. Figure 116 shows how the two different plans divide the city of Raleigh, and Table 41 shows that it is the case the the Duchin Plan spreads the resident of Raleigh out across more districts than does the Enacted Plan. The tactic of dividing Democratic cities in a 'pinwheel' or 'pizza' shape and grouping those 'slices' with more Republican suburban and exurban areas is a classic tactic to generate more Democratic districts and overcome the geographic clustering that is common among Democratic voters. The Enacted Plan keeps much more of Fayetteville within three districts.

Table 41: Division of Raleigh in Enacted Plan and Duchin Plan

	Percent of Raleigh in district	
District:	Enacted Plan	Duchin Plan
13 (22 in Duchin)	1.7	12.3
14	21.1	27.0
15	35.8	39.6
16	0	0
17	0	0
18	41.0	20.8
Total:	100%	100%

2016 Attorney General	0%	0%	0%	0%	**1%**	26%	73%
2014 Senate	0%	0%	0%	0%	**9%**	63%	27%

Note: Each row shows the percent of simulations that produce the number of Democratic leaning districts using the election or election index indicated in the row. The bolded number in each row is the number of Democratic leaning districts produced by the Enacted Plan using the equivalent election. For example, using the 2020 Presidential election 0% of the simulations produce 5 Democratic leaning districts. The Enacted Plan does, as the '5 Districts' cell is bolded in that row.

8.9 Iredell and Mecklenburg Senate County Grouping

The Iredell-Mecklenburg Senate county group contains 6 districts. In the Enacted Map these are Districts 37, 38, 39, 40, 41, and 42. The county cluster has an overall partisan index of .60, which is solidly Democratic. After conducting 50,000 initial simulations to create six districts in this cluster, I discard any simulations that contain more county traversals than the Enacted Plan. All 50,000 simulations meet this criteria. Next, I discard any simulations in which the average compactness score of the districts in the simulations is not as large or larger than the compactness score of the Enacted Map. This leaves 7,700 simulated maps, each containing six districts.

A map of the location of this county cluster in relation to the rest of the state is shown in Figure 118. A map of the Enacted Map's district boundaries and the Duchin Map's district boundaries within this county grouping are shown in Figure 119.

The distribution of district partisanship based on the statewide partisan elections index calculated for each of the simulation results is shown in Figure 120. The black bars show the distribution from the simulation results, with the percentage of simulations that generate each of the various possible number of Democratic seats in the cluster shown below each bar. The red vertical line shows the number of Democratic leaning seats in the Enacted Map in the same cluster, and the vertical dashed green line shows the number of Democratic leaning seats in the Duchin Map in the cluster. In 5% of the simulations there are 4 Democratic leaning districts. In 95% of the simulations there are 5 Democratic leaning districts. The Enacted Map generates 4 Democratic leaning districts, which is an outlier from middle 50% of the simulations. The Duchin Map also generates 5 Democratic leaning districts.

Table 43 breaks apart the partisan index into the 11 constituent elections and shows the distribution of Democratic leaning seats generated if one were to look at each election separately. Each row shows the percent of simulations that produce the number of Democratic leaning districts using the election or election index indicated in the row. The bolded number in each row is the number of Democratic leaning districts produced by the Enacted

Plan using the equivalent election. In 9 of the 11 individual elections the Enacted Plan is in alignment with the majority outcome of the simulation results.

Why is the Enacted Plan an outlier in this county grouping? There are two factors to consider in explaining this divergence. First, while the Enacted Plan generates 4 solidly Democratic leaning districts, the remaining two districts are not solidly Republican. Instead, one is solidly Republican. District 37 in Iredell County has a partisan index of 0.36. The other would be best classified as highly competitive. District 41 has a partisan index of 0.490. This district will likely be very closely decided with candidates from both parties winning them with some regularity, given their narrow margins. This is actually quite close to the partisan lean of the Duchin Plan. While the Duchin Plan creates 5 Democratic leaning districts in the county group, there is also one solidly Republican district. District 34 in Iredell County has a partisan index of 0.36. The other would be best classified as highly competitive. District 37 has a partisan index of 0.526. Thus, both plans generate 4 solidly Democratic districts, 1 solidly Republican district and 1 competitive districts. The Duchin Plan's competitive districts are just slightly more Democratic by roughly 3.6 percentage points.

The second factor to consider is that the partisan index is calculated using elections from 2014-2020. Looking at Table 43 we see that the Enacted Plan is in agreement with 100% of the simulations in the five elections from the most recent election cycle. Given the trend in Mecklenburg towards more support for Democratic candidates, elections conducted under the Enacted Plan will align more consistently with the more recent elections in the index. That is, the Enacted Plan will more often generate 5 Democratic districts as is the case in 2020 than it will generate 4 Democratic districts as it did in the elections in 2016 and earlier.

Figure 118: **Iredell and Mecklenburg County Senate Cluster**

2016 Attorney General	0%	0%	0%	0%	**51%**	49%	0%
2014 Senate	0%	0%	0%	0%	**99%**	1%	0%

Note: Each row shows the percent of simulations that produce the number of Democratic leaning districts using the election or election index indicated in the row. The bolded number in each row is the number of Democratic leaning districts produced by the Enacted Plan using the equivalent election. For example, using the 2020 Presidential election 100% of the simulations produce 5 Democratic leaning districts. The Enacted Plan does as well, as the '5 Districts' cell is bolded in that row.

8.10 Buncombe, Burke, and McDowell Senate County Grouping

The Buncombe-Burke-McDowell Senate county group contains 2 districts. In the Enacted Map these are Districts 46 and 49. The county cluster has an overall partisan index of .51, which is very slightly Democratic. After conducting 50,000 initial simulations to create two districts in this cluster, I discard any simulations that contain more county traversals than the Enacted Plan. This leaves 49,161 simulations that meet this criteria. Next, I discard any simulations in which the average compactness score of the districts in the simulations is not as large or larger than the compactness score of the Enacted Map. This leaves 18,137 simulated maps, each containing two districts.

A map of the location of this county cluster in relation to the rest of the state is shown in Figure 121. A map of the Enacted Map's district boundaries is shown in Figure 122. The Duchin Plan uses an alternative county grouping and is therefore not comparable to this cluster in the Enacted Plan. I analyze the Duchin Plan and the alternative cluster in a later section of this report.

The distribution of district partisanship based on the statewide partisan elections index calculated for each of the simulation results is shown in Figure 123. The black bars show the distribution from the simulation results, with the percentage of simulations that generate each of the various possible number of Democratic seats in the cluster shown below each bar. The red vertical line shows the number of Democratic leaning seats in the Enacted Map in the same cluster, and the vertical dashed green line shows the number of Democratic leaning seats in the Duchin Map in the cluster. In 100% of the simulations there is 1 Democratic leaning district. The Enacted Map is in alignment with the modal outcome of the simulations by also creating 1 Democratic leaning district.

Table 44 breaks apart the partisan index into the 11 constituent elections and shows the distribution of Democratic leaning seats generated if one were to look at each election separately. Each row shows the percent of simulations that produce the number of Democratic leaning districts using the election or election index indicated in the row. The bolded

number in each row is the number of Democratic leaning districts produced by the Enacted Plan using the equivalent election. In all 11 of the 11 individual elections there is agreement between the modal (most common) outcome in the simulations and the Enacted Map.

The black bars show the distribution from the simulation results, with the percentage of simulations that generate each of the various possible number of Democratic seats in the cluster shown below each bar. The red vertical line shows the number of Democratic leaning seats in the Enacted Map in the same cluster.

Table 44: Simulation Results by Individual Elections

Buncombe, Burke, and McDowell County Cluster

Number of Democratic Leaning Districts:			
	0	1	2
Individual Elections:			
2020 President	0%	**100%**	0%
2020 Senate	0%	**100%**	0%
2020 Governor	0%	**100%**	0%
2020 Lt. Governor	0%	**100%**	0%
2020 Attorney General	0%	**100%**	0%
2016 President	0%	**100%**	0%
2016 Senate	0%	**100%**	0%
2016 Governor	0%	**100%**	0%
2016 Lt. Governor	0%	**100%**	0%
2016 Attorney General	0%	**100%**	0%
2014 Senate	0%	**100%**	0%

Note: Each row shows the percent of simulations that produce the number of Democratic leaning districts using the election or election index indicated in the row. The bolded number in each row is the number of Democratic leaning districts produced by the Enacted Plan using the equivalent election. For example, using the 2020 Presidential election 100% of the simulations produce 1 Democratic leaning district. The Enacted Plan does as well, as the '1 District' cell is bolded in that row.

8.11 Cleveland, Gaston, and Lincoln Senate County Grouping

The Cleveland-Gaston-Lincoln Senate county group contains 2 districts. In the Enacted Map these are Districts 43 and 44. The county cluster has an overall partisan index of .34, which is strongly Republican. After conducting 50,000 initial simulations to create two districts in this cluster, I discard any simulations that contain more county traversals than the Enacted Plan. This leaves 4,074 simulations that meet this criteria. Next, I discard any simulations in which the average compactness score of the districts in the simulations is not as large or larger than the compactness score of the Enacted Map. This leaves only four unique maps that are as compact as the Enacted Plan.

A map of the location of this county cluster in relation to the rest of the state is shown in Figure 124. A map of the Enacted Map's district boundaries is shown in Figure 125. The Duchin Plan uses an alternative county grouping and is therefore not comparable to this cluster in the Enacted Plan. I analyze the Duchin Plan and the alternative cluster in a later section of this report.

Because there are only four maps that fit the criteria I use of equal population, county traversals, and compactness equal to or better than the Enacted Map, I do not present the distribution of district partisanship for the simulations here. It is sufficient to say that in the Enacted Map and the four remaining simulations, all create 2 Republican districts and 0 Democratic leaning districts, regardless of the index or election used. Table 45 shows this below.

Table 45 breaks apart the partisan index into the 11 constituent elections and shows the distribution of Democratic leaning seats generated if one were to look at each election separately. Each row shows the percent of simulations that produce the number of Democratic leaning districts using the election or election index indicated in the row. The bolded number in each row is the number of Democratic leaning districts produced by the Enacted Plan using the equivalent election. In all 11 of the 11 individual elections there is unanimous agreement between the simulations and the Enacted Map.

Partisan Lean of Districts

District:	Enacted Plan
43	0.37
44	0.31

Note: Partisan index is based on the two-party vote average of 11 statewide partisan elections between 2014-2020.

Table 45: Simulation Results by Individual Elections

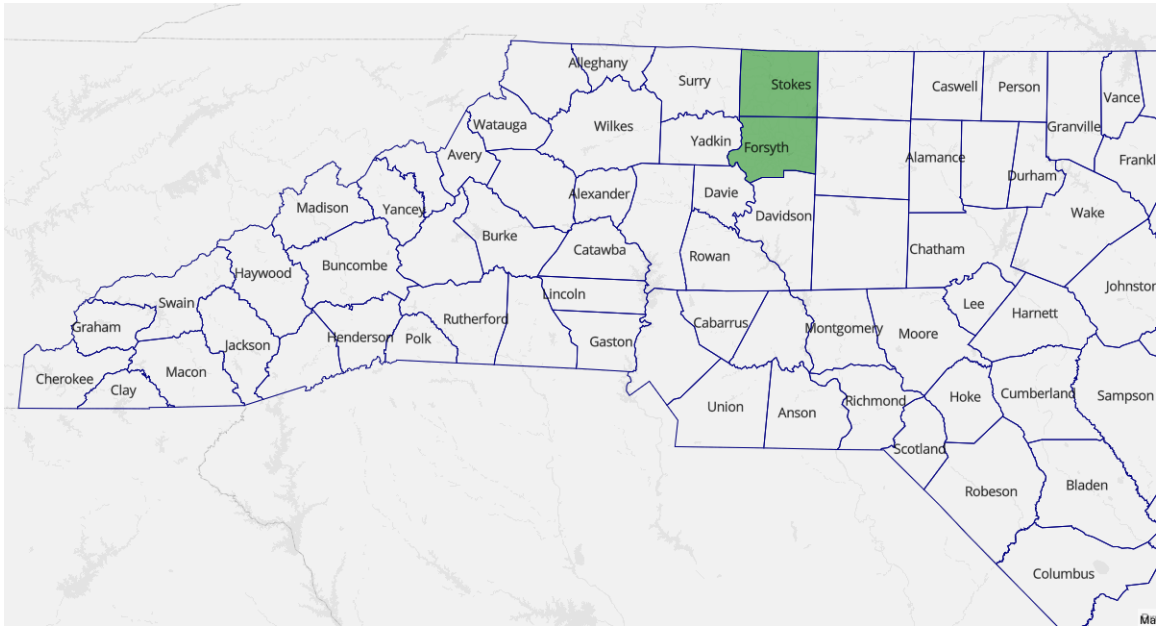
Cleveland, Gaston, and Lincoln Senate County Cluster

Number of Democratic Leaning Districts:			
	0	1	2
Individual Elections:			
2020 President	**100%**	0%	0%
2020 Senate	**100%**	0%	0%
2020 Governor	**100%**	0%	0%
2020 Lt. Governor	**100%**	0%	0%
2020 Attorney General	**100%**	0%	0%
2016 President	**100%**	0%	0%
2016 Senate	**100%**	0%	0%
2016 Governor	**100%**	0%	0%
2016 Lt. Governor	**100%**	0%	0%
2016 Attorney General	**100%**	0%	0%
2014 Senate	**100%**	0%	0%

Note: Each row shows the percent of simulations that produce the number of Democratic leaning districts using the election or election index indicated in the row. The bolded number in each row is the number of Democratic leaning districts produced by the Enacted Plan using the equivalent election. For example, using the 2020 Presidential election 100% of the simulations produce 0 Democratic leaning districts. The Enacted Plan does as well, as the '0 District' cell is bolded in that row.

8.12 Forsyth and Stokes Senate County Grouping

The Forsyth-Stokes Senate county group contains 2 districts. In the Enacted Map these are Districts 31 and 32. The county cluster has an overall partisan index of .52, which is slightly Democratic. After conducting 50,000 initial simulations to create two districts in this cluster, I discard any simulations that contain more county traversals than the Enacted Plan. This leaves 35,085 simulations that meet this criteria. Next, I discard any simulations in which the average compactness score of the districts in the simulations is not as large or larger than the compactness score of the Enacted Map. This leaves 9,601 simulated maps, each containing two districts.



A map of the location of this county cluster in relation to the rest of the state is shown in Figure 126. A map of the Enacted Map's district boundaries is shown in Figure 127. The Duchin Plan uses an alternative county grouping and is therefore not comparable to this cluster in the Enacted Plan. I analyze the Duchin Plan and the alternative cluster in a later section of this report.

The distribution of district partisanship based on the statewide partisan elections index calculated for each of the simulation results is shown in Figure 128. The black bars show the distribution from the simulation results, with the percentage of simulations that generate each of the various possible number of Democratic seats in the cluster shown below each bar. The red vertical line shows the number of Democratic leaning seats in the Enacted Map in the same cluster, and the vertical dashed green line shows the number of Democratic leaning seats in the Duchin Map in the cluster. In 100% of the simulations there is 1 Democratic leaning district. The Enacted Map is in alignment with the modal outcome of the simulations by also creating 1 Democratic leaning district.

Table 46 breaks apart the partisan index into the 11 constituent elections and shows the distribution of Democratic leaning seats generated if one were to look at each election separately. Each row shows the percent of simulations that produce the number of Democratic leaning districts using the election or election index indicated in the row. The bolded

number in each row is the number of Democratic leaning districts produced by the Enacted Plan using the equivalent election. In 8 of the 11 individual elections there is agreement between the modal (most common) outcome in the simulations and the Enacted Map. In 9 of the 11 individual elections the Enacted Map falls inside the middle 50% of simulation results.

2016 Attorney General	0%	**72%**	28%
2014 Senate	0%	**94%**	6%

Note: Each row shows the percent of simulations that produce the number of Democratic leaning districts using the election or election index indicated in the row. The bolded number in each row is the number of Democratic leaning districts produced by the Enacted Plan using the equivalent election. For example, using the 2020 Presidential election 98% of the simulations produce 1 Democratic leaning district. The Enacted Plan does as well, as the '1 District' cell is bolded in that row.

9 Comparison of Alternative Clusters to Those Chosen by the Legislature

In this section I compare the partisan index and simulations for the three alternative clusters chosen by the Duchin Plan and compare them to simulations in those same counties. The alternative clusters are very similar in their partisan indices as well as the partisan lean of the districts that are generated by the Enacted Map and the Duchin Map. This can be seen below in Table 47

Table 47: Senate Alternative County Grouping Analysis Summary

			# of Districts that are Democratic Leaning		
County Cluster	**Cluster Democratic Partisan Index**	**# Districts**	**Enacted Map**	**Duchin Map**	**Simulations**
Clusters Used by Enacted Plan					
Buncombe-Burke-McDowell	0.51	2	1		1
Cleveland-Gaston-Lincoln	0.34	2	0		0
Forsyth-Stokes	0.52	2	1		1
Alternative Clusters Used by Duchin Plan					
Buncombe-Henderson-Polk	0.54	2		1	1
Burke-Gaston-Lincoln	0.34	2		0	0
Forsyth-Yadkin	0.54	2		1	1
Total Enacted:		6	2	2	2
Total Duchin:		6	2	2	2

Note: Number of Democratic leaning districts is measured using the average two-party vote share in each district from the 11 statewide races noted earlier. Simulations range represents the middle 50% of outcomes from the simulations results. Clusters that fall outside of the simulation range are bolded.

9.1 Buncombe, Henderson, and Polk Senate Alternative County Grouping

The Buncombe-Henderson-Polk Senate alternative county group contains 2 districts. In the Duchin Map these are Districts 48 and 49. The county cluster has an overall partisan index of .53, which is slightly Democratic. After conducting 50,000 initial simulations to create two districts in this cluster, I discard any simulations that contain more county traversals than the Duchin Plan. This leaves 25,911 simulations that meet this criteria. Next, I discard any simulations in which the average compactness score of the districts in the simulations is not as large or larger than the compactness score of the Duchin Map. This leaves 17,474 simulated maps, each containing two districts.

A map of the location of this county cluster in relation to the rest of the state is shown in Figure 129. A map of the Duchin Map's district boundaries is shown in Figure 130.

The distribution of district partisanship based on the statewide partisan elections index calculated for each of the simulation results is shown in Figure 132. The black bars show the distribution from the simulation results, with the percentage of simulations that generate each of the various possible number of Democratic seats in the cluster shown below each bar. The vertical dashed green line shows the number of Democratic leaning seats in the Duchin Map in the cluster. In 100% of the simulations there is 1 Democratic leaning district. The Duchin Map is in alignment with the modal outcome of the simulations by creating 1 Democratic leaning district.

Table 49 breaks apart the partisan index into the 11 constituent elections and shows the distribution of Democratic leaning seats generated if one were to look at each election separately. Each row shows the percent of simulations that produce the number of Democratic leaning districts using the election or election index indicated in the row. The bolded number in each row is the number of Democratic leaning districts produced by the Duchin Plan using the equivalent election. In 7 of the 11 individual elections there is agreement between the modal (most common) outcome in the simulations and the Duchin Map. In 4

of the 11 individual elections the Duchin Map falls outside the middle 50% of simulation results and would be considered a statistical partisan outlier in these elections.

The Duchin Plan creates a solidly Democratic district and an additional very competitive district by dividing the city of Asheville. The Duchin Plan splits Asheville nearly equally across both districts while the Enacted Plan keeps the entirety of Asheville in one district. The tactic of dividing Democratic cities in a 'pinwheel' or 'pizza' shape and grouping those 'slices' with more Republican suburban and exurban areas is a classic tactic to generate more Democratic districts and overcome the geographic clustering that is common among Democratic voters. The Enacted Plan keeps the entirety of Asheville within one district. Table 48 shows the percent of Asheville voters in each district in each plan. It is clear that the Duchin plan splits Asheville into 2 roughly equal parts while the Enacted Plan places a much larger majority of Asheville into only 1 district. Figure 131 shows this division.

Table 48: Division of Asheville in Enacted Plan and Duchin Plan

	Percent of Asheville in district	
District:	Enacted Plan	Duchin Plan
46 (48 in Duchin)	0	42.8
49	100	57.2
Total:	100%	100%

2016 Governor	0%	100%	**0%**
2016 Lt. Governor	0%	**100%**	0%
2016 Attorney General	0%	**100%**	0%
2014 Senate	0%	**100%**	0%

Note: Each row shows the percent of simulations that produce the number of Democratic leaning districts using the election or election index indicated in the row. The bolded number in each row is the number of Democratic leaning districts produced by the Duchin Plan using the equivalent election. For example, using the 2020 Presidential election 0% of the simulations produce 2 Democratic leaning district. The Duchin Plan does, as the '2 District' cell is bolded in that row.

9.2 Burke, Gaston, and Lincoln Senate Alternative County Grouping

The Burke-Gaston-Lincoln Senate alternative county group contains 2 districts. In the Duchin Map these are Districts 43 and 44. The county cluster has an overall partisan index of .33, which is strongly Republican. After conducting 50,000 initial simulations to create two districts in this cluster, I discard any simulations that contain more county traversals than the Duchin Plan. This leaves 15,719 simulations that meet this criteria. Next, I discard any simulations in which the average compactness score of the districts in the simulations is not as large or larger than the compactness score of the Duchin Map. This leaves 13,370 simulated maps, each containing two districts.

A map of the location of this county cluster in relation to the rest of the state is shown in Figure 133. A map of the Duchin Map's district boundaries is shown in Figure 134.

The distribution of district partisanship based on the statewide partisan elections index calculated for each of the simulation results is shown in Figure 135. The black bars show the distribution from the simulation results, with the percentage of simulations that generate each of the various possible number of Democratic seats in the cluster shown below each bar. The vertical dashed green line shows the number of Democratic leaning seats in the Duchin Map in the cluster. In 100% of the simulations there are 0 Democratic leaning districts. The Duchin Map is in alignment with the modal outcome of the simulations by also creating 0 Democratic leaning districts.

Table 50 breaks apart the partisan index into the 11 constituent elections and shows the distribution of Democratic leaning seats generated if one were to look at each election separately. Each row shows the percent of simulations that produce the number of Democratic leaning districts using the election or election index indicated in the row. The bolded number in each row is the number of Democratic leaning districts produced by the Duchin Plan using the equivalent election. In all of the 11 individual elections there is agreement between the modal (most common) outcome in the simulations and the Duchin Map.

2016 Lt. Governor	**100%**	0%	0%
2016 Attorney General	**100%**	0%	0%
2014 Senate	**100%**	0%	0%

Note: Each row shows the percent of simulations that produce the number of Democratic leaning districts using the election or election index indicated in the row. The bolded number in each row is the number of Democratic leaning districts produced by the Duchin Plan using the equivalent election. For example, using the 2020 Presidential election 100% of the simulations produce 0 Democratic leaning districts. The Duchin Plan does as well, as the '0 Districts' cell is bolded in that row.

9.3 Forsyth and Yadkin Senate Alternative County Grouping

The Forsyth and Yadkin Senate alternative county group contains 2 districts. In the Duchin Map these are Districts 31 and 32. The county cluster has an overall partisan index of .53, which is slightly Democratic. After conducting 50,000 initial simulations to create two districts in this cluster, I discard any simulations that contain more county traversals than the Duchin Plan. This leaves 48,151 simulations that meet this criteria. Next, I discard any simulations in which the average compactness score of the districts in the simulations is not as large or larger than the compactness score of the Duchin Map. This leaves 19,706 simulated maps, each containing two districts.

A map of the location of this county cluster in relation to the rest of the state is shown in Figure 136. A map of the Duchin Map's district boundaries is shown in Figure 137.

The distribution of district partisanship based on the statewide partisan elections index calculated for each of the simulation results is shown in Figure 139. The black bars show the distribution from the simulation results, with the percentage of simulations that generate each of the various possible number of Democratic seats in the cluster shown below each bar. The vertical dashed green line shows the number of Democratic leaning seats in the Duchin Map in the cluster. In 100% of the simulations there are 0 Democratic leaning districts. The Duchin Map is in alignment with the modal outcome of the simulations by also creating 0 Democratic leaning districts.

Table 52 breaks apart the partisan index into the 11 constituent elections and shows the distribution of Democratic leaning seats generated if one were to look at each election separately. Each row shows the percent of simulations that produce the number of Democratic leaning districts using the election or election index indicated in the row. The bolded number in each row is the number of Democratic leaning districts produced by the Duchin Plan using the equivalent election. In all of the 11 individual elections there is agreement between the modal (most common) outcome in the simulations and the Duchin Map.

The Duchin Plan creates a solidly Democratic district and an additional very compet-

itive district by dividing the city of Winston-Salem. While Winston-Salem is too large to be a single district, the Duchin Plan splits Winston-Salem nearly equally across both districts while the Enacted Plan keeps a larger share of Winston-Salem in one district. The tactic of dividing Democratic cities in a 'pinwheel' or 'pizza' shape and grouping those 'slices' with more Republican suburban and exurban areas is a classic tactic to generate more Democratic districts and overcome the geographic clustering that is common among Democratic voters. The Enacted Plan keeps much more of Winston-Salem within one district. Table 51 shows the percent of Winston-Salem voters in each district in each plan. It is clear that the Duchin plan splits Winston-Salem into 2 roughly equal parts while the Enacted Plan places a much larger majority of Winston-Salem into only 1 district. Figure 138 shows this division.

Table 51: Division of Winton-Salem in Enacted Plan and Duchin Plan

	Percent of Winston-Salem in district	
District:	Enacted Plan	Duchin Plan

2016 Governor	0%	62%	**38%**
2016 Lt. Governor	3%	**97%**	0%
2016 Attorney General	0%	**84%**	16%
2014 Senate	0%	**98%**	2%

Note: Each row shows the percent of simulations that produce the number of Democratic leaning districts using the election or election index indicated in the row. The bolded number in each row is the number of Democratic leaning districts produced by the Duchin Plan using the equivalent election. For example, using the 2020 Presidential election 44% of the simulations produce 2 Democratic leaning districts. The Duchin Plan does as well, as the '2 Districts' cell is bolded in that row.

10 Conclusion

Based upon my analysis of North Carolina's recently enacted redistricting plans for the General Assembly and the plans submitted by the North Carolina League of Conservation Voters, it is my opinion that the Enacted Maps are not "extreme partisan gerrymanders" as plaintiffs allege.

I come to this opinion through the use of a redistricting simulation algorithm to generate 50,000 simulated district maps in each county grouping in which there are multiple districts in both the North Carolina House of Representatives and the North Carolina Senate. The redistricting algorithm generates a representative sample of districts by following neutral redistricting criteria without regard to racial or partisan data. In this way, the simulated

districts establish a comparison set of plans that use purely non-partisan redistricting inputs. I then compare the simulated plans against the Enacted Plans and the Duchin Plans by reference to election results to assess whether the partisan effects of those plans are consistent with what one would expect to see in a redistricting plan composed without reference to any partisan considerations.

In the House, these simulations show that the Enacted Plans consistently score more often within the range of the non-partisan simulated maps than the Duchin Plans. In addition, the simulations show that the Enacted Plans contain one county grouping, the Guilford County grouping in the House of Representative, that is a partisan outlier. However, this grouping largely follows the boundaries of a 2019 court-approved district plan. In contrast, the Duchin Plans generate partisan outliers in four county groupings.

In the Senate analysis both the Enacted and Duchin plans generate partisan outliers when compared to the simulated district maps in two clusters each. Furthermore, neutral redistricting criteria such as following municipal lines support the decisions by the map drawers in the Enacted Plan in more districts, while in these same districts the Duchin Plan divides Democratic-leaning municipalities into more pieces in order to combine Democratic-leaning voters in cities with Republican voters in suburban and rural parts of North Carolina to create additional competitive or Democratic-leaning districts.

Based on the evidence and analysis presented below, my opinions regarding the 2021 enacted redistricting plans in the North Carolina General Assembly can be summarized as follows:

- The contemporary political geography of North Carolina is such that Democratic majorities are often geographically clustered in the largest cities of the state while Republican voters often dominate the suburban and rural portions of the state.

- This is not the case in the rural northeastern region of the state, where there are also significant Democratic majorities.

- This geographic clustering in cities an in the rural northeast puts the Democratic Party at a natural disadvantage when single-member districts are drawn.

- This is further amplified by the 'county grouping' process that is unique to North Carolina's redistricting process where districts are constrained to remain within county groups.

- This disadvantage partially arises from the difficulty, and in many cases impossibility, of drawing Democratic-leaning districts in many of the county groupings that comply with constitutional requirements, even though Democratic voters make up roughly 40% of voters in these parts of the state.

- Based on a comparison between the Enacted Plan, the Duchin Plan, and a set of 50,000 simulated maps, the Enacted Plan is less of a partisan outlier than the Duchin Plan in the State House.

- In the Senate analysis both the Enacted and Duchin plans generate partisan outliers when compared to the simulated district maps in two clusters each.

- Areas of disagreement between proposed plans often arise because the Duchin plan divides Democratic leaning municipalities into more pieces in order to combine Democratic-leaning voters with Republican voters in suburban and rural parts of the state to create additional competitive or Democratic leaning districts.

- Given these results, as well as the otherwise high degree of agreement between the Enacted and Duchin maps, it is my opinion that the Enacted Maps are not "extreme partisan gerrymanders" as plaintiffs allege.

I. Introduction and Qualifications

I have been hired by the legislative defendants to provide expert testimony in the consolidated cases of *Harper et al v. Hall et al* and *North Carolina League of Conservation et al v. Hall et al*. More specifically, I have been asked by the legislative defendants to provide my opinion regarding the congressional and state legislative districting plans enacted by the North Carolina General Assembly in 2021 deploying my knowledge of North Carolina political history and legislative politics, comparative politics, and American national and state politics and policy.

I am a tenured professor of political science at North Carolina State University. I received my Ph.D. from the University of Connecticut in 1995 and have taught at NC State for the 26 years since then—the past fourteen as a full professor. I teach an array of courses in American politics and served as chair of the Department of Political Science from 2006 to 2010 and President of the North Carolina Political Science Association in 2012-13. I have written four books and published extensively in political science journals. I have authored 28 peer-reviewed articles and numerous book chapters, reports, and other published work.

I have expertise in political science matters related to these cases. I use a diverse array of methodologies in my work, including different statistical techniques. I have been interviewed by scores of media outlets about issues relating to redistricting and North Carolina politics and policy and given dozens of talks to political and civic groups on these topics over the past quarter century. Some of my academic research analyses these matters. I believe the principal reason I have been hired as an expert in these cases

is that my extensive experience and broad interests in American, North Carolina, comparative, and state politics enable me to offer an integrated and panoramic social scientific understanding of the large and complex questions before the court. My CV, which lists my complete credentials, is attached to this report as Appendix A.

The analyses and opinions I provide in this report are based upon my education in social science methods and knowledge of the relevant academic literature. These skills are well-suited to this analysis. My conclusions stated herein are based upon my review of the information available to me at this time. In my professional judgment this is sufficient basis for my opinions notwithstanding the unusually short period I have been given to write this report. I reserve the right to alter, amend, or supplement these conclusion based upon further study or based upon the availability of additional information and within the confines of the court's truncated scheduling order. I am being compensated for my time in preparing this report at the rate of $425/hour. My compensation is in no way contingent on the conclusions reached as a result of my analysis. The opinions in this report are my own, and do not represent the view of North Carolina State University.

II. Executive Summary

The substantive part of the report is divided into five sections: "The Redistricting Process in North Carolina in 2021", "*Common Cause v. Lewis* and the Constitution of the State of North Carolina", "Proportionality, Competitiveness, and the Properties of a 'Partisan

Gerrymander'", "Additional Conceptual and Analytical Considerations", and "A Recent History of North Carolina Party Politics". My findings are:

i. Regarding the process used by the North Carolina General Assembly to conduct redistricting in 2021.

- Compared to those of other states, the Constitution of North Carolina provides its state legislature with considerable authority and latitude in the formation and enactment of district plans.
- In 2021, the state legislature deployed a process that was comparatively transparent, open, and participatory.

ii. Regarding the case of *Common Cause v. Lewis*, the Constitution of North Carolina, and the plaintiffs' related claims.

- The constitutional provisions that describe Article I rights the plaintiffs believe to have been violated in these cases by the enacted plans—"the free elections" clause, "the equal protection" clause, "the freedom of speech" clause, and "the freedom of assembly" clause—are derived from practices and ideas unrelated to concerns about partisanship and redistricting.
- Political scientists' common understanding of the concept of a "partisan gerrymander" is different from the discipline's understanding of free elections, equal elections, the freedom of speech, and the freedom of assembly.

- Political scientists consider many other political rights that states, including North Carolina, restrict to be constitutive of free elections, equal elections, the freedom of speech, and the freedom of assembly—common burdens on these rights include ballot access, voter registration rules, fair access to the media, campaign finance regulations, etc.

iii. Regarding methods and principles used by political scientists to identify a "partisan gerrymander".

- The plaintiffs wish to see different qualities in the enacted plans particularly proportionality and district competitiveness, but these are often contradictory and elusive and proportionality, at least, is not intrinsic to our electoral system.
- The various methods political scientists use to evaluate district plans generate different results and, in turn, conclusions regarding the extent to which a plan is a "partisan gerrymander"—that is, the choice of method can be determinative of an investigator's assessment.
- "Partisan gerrymandering" is an abstract and complex political science concept that defies clear standards for decisive analysis.

iv. Regarding additional analytical and conceptual challenges facing political scientists as they evaluate district plans.

- There exists a "natural gerrymander" created by the uneven distribution of the general population across the state and within crucial units of redistricting such as counties, voting tabulation districts (VTDs), and

"communities of interest" and the concentration of Democratic voters in urban areas and Republican voters in rural areas.

- The choice of "baseline" statewide elections to evaluate the partisan nature of district plans is arbitrary and can have material effects on the assessment of a plan.
- Terms like "community" are vague and of little practical utility to political scientists offering a principled and objective analysis of enacted district plans.

v. Regarding North Carolina party politics.

- The geographic character of the North Carolina Democratic and Republican parties' support has changed dramatically over the past thirty years, with implications for electoral competitiveness.
- Much of this is a function of discretionary decisions made by state and national party leaders, elected officials, and activists and very little of it can be attributed to redistricting practices.

III. The Redistricting Process in North Carolina in 2021

i. Method

In this section, I use my knowledge and a survey of the academic literature to analyze the manner in which the General Assembly conducted the redistricting of North Carolina's congressional and Senate and House districts in 2021, a matter the plaintiffs in *Harper* and *NCLCV* have placed at the center of their complaint. The approach, typical

in political science, is to place the legislature's actions in historical and comparative state perspective.

ii. Constitutional Context

The U.S. Bureau of the Census released data to the states so that they could begin their redistricting on August 12, 2021 (they were released in easier-to-use form on September 16). This was much later than initially intended (the original statutory deadline to complete delivery of redistricting was March 31, 2021) because of the coronavirus pandemic and data anomalies. Under the authority of the Constitution of the State of North Carolina (Article II §§3, 5), the North Carolina General Assembly has the responsibility to redraw district lines for the state's U.S. House districts and state legislative districts. This power is the General Assembly's alone. It must exercise this "at the first regular session convening after the return of every decennial census of population taken by order of Congress following the decennial national census". It cannot avoid the charge. For both the congressional and state legislative maps, unlike roughly half of the states, North Carolina law grants authority to enact district plans to neither non-partisan institutional legislative staff nor a commission with all or some members who are either non-legislators or appointed by officers outside of the legislature.[1]

Moreover, Article II, § 22 of the Constitution states redistricting plans are not ordinary legislation. Like Connecticut, Florida, Maryland, Mississippi (in the case of the

[1] The Constitution mentions congressional redistricting only in passing in Article II, § 22 (5) (c). Here it states the congressional district plan is a bill not subject to gubernatorial amendment.

state legislature) and Connecticut (in the case of Congress), the maps are not presented to the Governor. The executive cannot exercise its veto power.[2] But even in these other states, the legislature's power to devise plans is limited somewhat. In Connecticut, a two-thirds majority of both chambers is needed to approve plans and if the legislature misses statutory deadlines a nine-member back-up commission is charged with drawing the maps. In Maryland, the Governor submits a map the legislature can ignore, but if the legislature misses a legal deadline back-up procedures take effect and its power to draw the plan is consequently curtailed. Ultimately, the Governor's plan is enacted absent the legislature approving theirs. Mississippi has a back-up commission consisting of non-legislative members.

In drawing its state legislative districts, Florida uses a process most like North Carolina's. There, however, state legislative district maps are automatically submitted to the Florida Supreme Court for approval. In the event that the court rejects the lines, the legislature is given a second chance to draft a plan. If the legislature cannot approve a state legislative redistricting plan, the state attorney general must then ask the state supreme court to draft one. It is only in North Carolina that the legislature expressing its will through a simple majority vote in both chambers has sole authority under state law to

[2] The people approved an amendment to the Constitution bringing about the executive veto in 1996. Legislative Democrats were generally against the proposal. Governors, particularly Jim Martin and Jim Hunt, and legislative Republicans were in favor. A compromise was struck in which, unlike a large majority of the states' governors, North Carolina's governor would not have the line-item veto. Veto overrides would also require only a vote of three-fifths of members of both legislative bodies (most states require two-thirds) and redistricting legislation would not be subject to the veto (Christensen 2008, 246; Fleer 1994, 115-6; *New York Times* 1995).

draw congressional and state legislative maps.[3] These rules were affirmed when the current Constitution was written in 1971, a time when the Democratic Party enjoyed large and electorally-secure majorities in the General Assembly.[4]

The mandates that limit the North Carolina legislature's discretion are therefore unrelated to process. They concern the content of the maps and are directed by federal and state statutory and constitutional law and court decisions. Many of them were recited by the "Criteria Adopted by the Committees" approved at a joint meeting of the General Assembly's House Committee on Redistricting and Senate Committee on Redistricting and Elections on August 12, 2021.[5] I will return to them throughout the report. Probably the most important are that the districts be single-member and contain equal population, be contiguous and compact in shape, minimize the traversal of county lines and splitting of voting tabulation districts (VTDs or essentially precincts or wards), and be sensitive to what are frequently called "communities of interest".[6]

[3] There are a number of reputable and comprehensive reference sources for this information freely available on the Internet. These include the site of the National Conference of State Legislatures (https://www.ncsl.org/research/redistricting.aspx), the site of academics Justin Levitt and Doug Spencer (https://redistricting.lls.edu/), and the Princeton Gerrymandering Project (https://gerrymander.princeton.edu/). The Congressional Research Service's report, "Congressional Redistricting 2021: Legal Framework" (https://crsreports.congress.gov/product/pdf/LSB/LSB10639) provides a nice overview to the role of federal law in the process.

[4] The Constitution of 1971 was "an extensive editorial revision of the entire constitution incorporating relatively noncontroversial substantive changes without altering the fundamental character of the document" (Fleer 1994, 51). Proposed changes regarding executive power were rejected by the people.

[5] https://www.ncleg.gov/documentsites/committees/Senate2021-154/2021/08-12-2021/Criteria.adopted.8.12.pdf

[6] In 2021, there are 14 U.S. House districts apportioned by federal law and 50 state Senate and 120 state House districts as directed by Article II §§2, 4 of the Constitution of North Carolina.

For the 2021 redistricting cycle, the House and Senate redistricting committees did adopt criteria concerning the configuration of the maps, however. These criteria were more stringent than those of 2011 and presumably recommended to the committees by legislators' understanding of federal and state law and court decisions and in anticipation of potential legal challenges to the congressional and state legislative district plans. Most notably, the committees prohibited the use of election-result data and data identifying the race of individuals. In *Cooper v. Harris* in 2017, the U.S. Supreme Court ruled that in drawing two congressional districts after the 2010 census, the North Carolina General Assembly used race as "the predominant factor", an action that did not survive the "strict scrutiny" jurisprudential standard.[7] In 2018, it essentially reiterated this in a case involving state legislative districts.[8] Legislators were also instructed this year not to use "partisan considerations". In *Common Cause v. Lewis* in 2019, a three-judge Superior Court panel essentially ruled that drawing state district lines for the clear purpose of advantaging the majority party's interests violated the North Carolina Constitution.[9] Both *Cooper* and *Common Cause* resulted in the General Assembly having to draw remedial maps.

iii. Addressing the Plaintiffs' Claims

The plaintiffs claim the redistricting process was inadequate in some way. In the *Harper* complaint, they assert, "Legislative Defendants undertook an opaque and

[7] 137 S.Ct. 1455 (2017).
[8] *North Carolina v. Covington*, 138 S.Ct. 2548 (2018)
[9] 373 N.C. 258 (N.C. 2019).

constricted redistricting process".[10] It would be fair to ask: Compared to what? Based upon my experience and extensive review, there exist no comprehensive systematic studies of how state legislatures have conducted their redistricting over the past several decades. Political science research has focused exclusively on the substance of maps. Indeed, a recent study in *Political Research Quarterly* on the determinants of state and federal redistricting cases omits any measure of the rules or procedures used by state legislatures in the formulation of district plans. The researchers focus on the form the maps take and political, social, and racial characteristics of states and find that, incidentally, among the variables generating a material effect are the size of the African-American population and the number of cases the state has been party to previously (Gimpel, Hightower, and Wohlfarth. 2021). This helps us understand why North Carolina has become the target of so many redistricting suits since 2010.

The National Conference of State Legislatures (NCSL) has observed, however, that before the 2010 cycle the processes used by state legislatures to draw congressional and state legislative maps were not unlike the processes used to write and approve regular legislation.[11] In North Carolina, both chambers of the General Assembly publish journals containing information about bills, amendments, and votes as per Article II, § 17 of the state Constitution. In recent years, citizens have been able to view and listen to live video and audio streams of proceedings on the General Assembly's website. The website contains other information, including bills filed and notices of committee meetings. This

[10] Verified complaint in *Harper v. Hall*.
[11] https://www.ncsl.org/research/redistricting/into-the-thicket-a-redistricting-starter-kit-for-legislative-staff.aspx

is a dramatic improvement in terms of transparency on the situation prior to 2000 when the institution was considerably more opaque.

NCSL does observe a change from 2010. State legislatures are increasingly making the redistricting process transparent and participatory. The two practices most frequently used to facilitate this are "listening tours" and receiving district plan proposals directly from the public. These are both things the North Carolina General Assembly did in 2021. Although restricted by the coronavirus pandemic, the late release of the census data, and compressed timeline (an original filing deadline of December 17, 2021 and primary originally scheduled on March 8, 2022), the redistricting committees held 13 public hearings across the state and a further four over two days in October once maps had been proposed. This was in addition to the usual input members of the public are free to provide lawmakers on ordinary legislation.[12] The General Assembly also livestreamed proceedings on its website. It maintained a public redistricting workroom with a dedicated terminal that anyone could schedule to use. The maps citizens drew became part of the public record.

All members of the House and Senate had the opportunity to debate and then vote on three readings of the three bills (SB 740 for the congressional plan, HB 976 for the state House plan, and SB 739 for the state Senate plan). In sum, with the exception of the dramatic use of a lottery machine to help determine the state legislative plans from among five alternatives, the 2019 court-ordered process to redraw maps was practically

[12] Article I § 12 of the Constitution permits the people "to instruct their representatives and to apply to the General Assembly for redress of grievances".

identical to the 2021 process, particularly with regards to public participation and the openness of committee and floor proceedings. Several Democratic state legislators characterized what happened in 2019 as exceptionally fair and transparent (Bitzer 2021, 136).

The final recorded votes on the third reading of the three 2021 redistricting plans were: Congressional plan 65-49 in the House and 27-22 in the Senate; state Senate plan 65-49 in the House and 26-19 in the Senate; and state House plan 67-49 in the House and 25-21 in the Senate.[13] As far as we know, none of the proceedings violated the state constitutional requirements in Article II, § 12, 17, 18, 19 that pertain to member responsibilities and rights in the consideration of legislation.[14]

The plaintiffs claim the maps were drawn as the result of "partisan considerations".[15] As with many high-profile votes in today's partisan American legislatures, the recorded votes were partisan and no Republicans voted against any of the maps and no Democrats voted in favor of any of them. The state Senate plan, however, was altered by two floor amendments offered by Democratic senators.[16] Moreover, regardless of the motivations for individual members' votes in this matter, the North Carolina General Assembly itself is not uniquely partisan and polarized. To date, in the 2021-22 session more than 75

[13] These votes can be found on the North Carolina General Assembly's website, https://www.ncleg.gov/Legislation/Votes/2021

[14] These have to do with members' oath to discharge their duties as legislators (Section 12), requiring the bodies keep a journal of their proceedings (Section 17), essentially permitting any member to oppose legislative action and have that opposition made public record (Section 18), and allowing for recorded votes (Section 19).

[15] Verified complaint in *Harper v. Hall*, p. 12.

[16] They were Sen. Natasha Marcus and Sen. Ben Clark.

percent of House roll-call votes and 80 percent of Senate roll-call votes have had in excess of 60 percent of members on one side. According to widely-cited research using roll-call and survey data from state legislatures and a recognized ideal-point estimation statistical technique to place individual legislators on a single liberal-to-conservative ideological dimension, the difference in median annual ideology scores between House Republicans and Democrats and Senate Republicans and Democrats from 2010-18 are just slightly higher than the national average (North Carolina House 1.64, other states' houses 1.63; North Carolina Senate 1.66, other states' senates 1.61). The North Carolina House has become more partisan and polarized according to these measures since 2010 (from 1993 to 2009 its mean difference score was 1.26, compared to the national 1.37) but the state's Senate has actually become less partisan and polarized (from 1993 to 2009 its mean difference score was 1.72, compared to the national 1.36) (Shor and McCarty 2011).[17]

IV. *Common Cause v. Lewis* and The Constitution of the State of North Carolina

i. Method

Here, I use my knowledge and experience as a political scientist and examine the comparative and historical political science literature to ascertain whether it is reasonable to argue, as the plaintiffs do, that the enacted plans are in violation of state constitutional provisions concerning "free elections", "equal protection", "freedom of speech", and

[17] Shor and McCarty's updated data can be found at: https://americanlegislatures.com/data/

"freedom of assembly". My opinion is not legal, rather I draw on these concepts as understood historically and by the political science literature to evaluate their relationship with the plaintiffs' assertions.

ii. *Common Cause* and the Plaintiffs' Complaints

In 2019, a three-judge panel of a Superior Court in Wake County ruled the 2017 state House and Senate district plans to be unconstitutional "extreme partisan gerrymanders". The essence of the decision in *Common Cause v. Lewis* was that the maps violated three state constitutional provisions: The "free elections" clause (Article I, §10), the "equal protection" clause (Article I, § 19), and, together, the "freedom of speech" and "freedom of assembly" clauses (Article I, § 14 and Article I § 12). The plaintiffs in *Harper* and *NCLCV* claim forcefully the district plans violate these provisions of the North Carolina Constitution.

The Court in *Common Cause* seemed to be taking its lead from a 2018 Pennsylvania decision. In *League of Women Voters of Pennsylvania et al v. Commonwealth of Pennsylvania et al*, the Supreme Court found that state's 2011 congressional district plan violated Article I, § 5 of its Constitution that asserts, "Elections shall be free and equal; and no power, civil or military, shall at any time interfere to prevent the free exercise of the right of suffrage."[18] In *Common Cause*, the Superior Court invoked North Carolina's "free elections" constitutional provision, despite its omission of the term "equal". Perhaps sensitive to the difference and to draw a more direct connection between the

[18] 178 A.3d 737 (Pa. 2018).

North Carolina and Pennsylvania situations, it asserted the plans before it were also in violation of the Constitution of North Carolina's Article I, § 19 guaranteeing "equal protection".

This reference to the equal protection clause is important. First, it should be noted the relevant provision reads that, "No person shall be denied the equal protection of the laws; nor shall any person be subjected to discrimination by the State because of race, color, religion, or national origin." There is no reference to anything remotely related to partisanship. Second, the part of the XIV Amendment of the U.S. Constitution the North Carolina provision mimics has almost exclusively been deployed in connection with government action that is considered discriminatory on the grounds of characteristics like gender, age, national origin, and, especially, race (Arazia 2018). It is interesting that all the plaintiffs in both cases introduce themselves as Democratic voters and most of the plaintiffs in *NCLCV* also present themselves as Black voters. The two characteristics, race and partisanship, should not be conflated. Race is an established constitutionally suspect category that receives strict scrutiny when states legislate on matters related to fundamental rights like voting. It is also a significant and explicit factor in federal restrictions on the redistricting process, such as those enumerated in the Voting Rights Act and the now established principle that, to use Justice Anthony Kennedy's descriptor in *Miller v. Johnson*, race cannot without justification be the "predominant" factor motivating the drawing of districts.[19] Partisanship, by contrast, is not innate, immutable, or central to a person's being. Voting for candidates of a particular party is a choice and

[19] 515 U.S. 900 (1995).

purely incidental to most people's lives. It is something that could be used to describe the class of people the plaintiffs consider "Democratic voters" for little more than a few minutes every two, perhaps even every four, years.

iii. The State Constitution and the Derivation of the Rights in Question

As the Court observed in *Common Cause*, the origins of several of the constitutional rights it invoked can be found far back in the state's history. It noted the source of the "free elections clause" is located in the North Carolina Declaration of Rights of 1776, which in turn borrowed it from the English Bill of Rights of 1689 (Orth 1992).[20] It also claimed North Carolina's embrace of free elections drew inspiration from language in other state constitutions, including Pennsylvania's.[21] The 1868 North Carolina Constitution, written following the Civil War, contained a "free elections clause" in its Article I §, 10—although the words "ought to" were in place of today's "shall".

If the origins of the provision go back to 1776, it was established prior to any meaningful American understanding of the term "gerrymander" which was largely popularized following the 1810 redistricting cycle when the Governor of Massachusetts Elbridge Gerry signed a state legislative district plan that was said to greatly favor his Democratic-Republican Party (Engstrom 2013, 21-22). In 1868, and even in 1971 when today's Constitution was established, the concept of a "partisan gerrymander" does not

[20] It should be noted, however, that it was not until the passage of the "Great" Reform Act in 1832 that Britain rid itself of "rotten boroughs", districts with very small constituencies that often elected members of parliament who were essentially selected by a single or small group of powerful residents (Evans 1994).
[21] *Common Cause v. Lewis*, 303.

appear to have been addressed or contemplated by convention delegates and the state's population. With the exception of the short "fusionist" period of the 1890s when Republicans had control of the General Assembly and the governorship, North Carolina was a solidly one-party state for more than a century following the Civil War. It was not until 1972 that North Carolina elected its first Republican Governor and U.S. Senator of the twentieth century and 1994 that it elected that party's first state legislative majority by giving Republicans control of the House.[22]

The same logic applies to the "freedom of assembly" provision. Article I, § 25 of the 1868 Constitution reads, "The people have the right to assemble together to consult for their common good, to instruct their representatives, and to apply to the Legislature for the redress of grievances". Given this was written in 1868, it seems difficult to imagine the authors were contemplating partisan gerrymandering as a practice in contravention of the freedom of assembly.

The "freedom of speech" wording was only written into the Constitution in 1971. It was tacked on to the beginning of the "freedom of the press" clause which occupied Article I, § 20 of the 1868 Constitution—and, like "free elections", the 1971 Constitution believed it "shall" as opposed to "ought" "never be restrained". Again, the origins suggest no intent to include the concept of a "partisan gerrymander".[23] In summary,

[22] Kruman (1983, 154) discusses partisan battles over redistricting in North Carolina between Democrats and Whigs in the early 1850s. The Civil War and the demise of Reconstruction, however, made North Carolina a solidly Democratic state.

[23] Today, Article I, § 14 reads, "Freedom of speech and of the press are two of the great bulwarks of liberty and therefore shall never be restrained, but every person shall be held responsible for their abuse."

based upon my review as a political scientist of North Carolina's political history, there seems no support for the drawing of a connection between the constitutional rights of free elections, equal protection, freedom of speech, and freedom of assembly on one hand and partisan redistricting practices on the other.

iv. State Constitutions and the "Partisan Gerrymander"

In fact, when states expressly wish to prohibit partisan gerrymandering, they establish laws to that effect. Academics Justin Levitt and Doug Spencer estimate 19 states have statutes or constitutional provisions restricting the practice of "undue partisanship" in state legislative redistricting, 17 have such statutes or constitutional provisions addressing congressional redistricting.[24] The following examples provide just a flavor of how this can be done if a state so desires. Article III, § 20 of the Florida State Constitution states, "No apportionment plan or individual district shall be drawn with the intent to favor or disfavor a political party." Article III, § 3 of the Missouri State Constitution states, "Districts shall be drawn in a manner that achieves… partisan fairness." The entire eleventh article of the Ohio State Constitution is devoted to redistricting and Section 6, Clause A states, "No general assembly district plan shall be drawn primarily to favor or disfavor a political party". Article IV, Part 2, § 1(14) of the Arizona State Constitution reads, "to the extent practicable, competitive districts be favored where doing so would not significantly detract from" criteria such as equal population, compactness, and the

[24] https://redistricting.lls.edu/redistricting-101/where-are-the-lines-drawn/#partisan+outcomes

protection of communities of interest. North Carolina has no constitutional provision related to the partisan make-up or competitiveness of districts.

Moreover, the U.S. Supreme Court ruled in 2019 in a case involving North Carolina that partisan gerrymandering was outside the ambit of the federal courts as a politically non-justiciable question.[25] As a result, therefore, state courts are left to determine whether their statutes and constitutions, absent a provision related to partisan redistricting practices, prohibit partisan gerrymandering. Prior to *Common Cause*, they had only done this definitively once, in the 2018 Pennsylvania case.

v. Political Science and the Concepts of "Free Elections", "Equal Elections", "Freedom of Speech", and "Freedom of Assembly"

As a political scientist, I find it hard to think of American practices of redistricting, regardless of how skewed in a partisan sense the outcomes seem, to be evidently inconsistent with the principles of "free elections", "equal elections", "freedom of speech", and "freedom of assembly". To explain, let me take each of these concepts in turn, beginning with "free elections".

Freedom House, a highly respected non-profit, non-partisan, non-governmental organization that conducts research and advocacy on democracy, political freedom, and human rights, clearly dislikes what it calls "partisan gerrymandering".[26] The

[25] *Rucho v. Common Cause*, 139 S.Ct. 2484 (2019). There was a companion case out of Maryland, *Benisek v. Lamone*, 139 S.Ct. 2484 (2019).
[26] See, for example, https://freedomhouse.org/sites/default/files/2021-03/US_Democracy_Report_FINAL_03222021.pdf

methodology it uses to conduct its "Freedom in the World" analysis, however, includes "partisan gerrymandering" specifically in response to the following question it asks of countries: "Are the electoral laws and framework fair, and are they implemented impartially by the relevant election management bodies?" The phenomenon is not used to evaluate how countries respond to this question: "Were the current national legislative representatives elected through free and fair elections?"[27] In the numerous political science reference materials that describe free elections, the key characteristics are things such as whether elections are called in a timely manner, candidates have access to the media, members of the public can vote without undue pressure or intimidation, ballots are cast in secret, and the vote count is transparent and timely.

The Economist's *Democracy Index* which clearly places "free elections" at the heart of its understanding of democracy, makes no mention of redistricting in its methodology. Its unfortunate assessment in 2020 was that the United States is a "flawed democracy" noting that although "Americans have become much more engaged in politics in recent years" they show "low levels of trust in institutions and political parties, deep dysfunction in the functioning of government, increasing threats to freedom of expression, and a degree of societal polarization that makes consensus almost impossible to achieve".[28] It is plausible some political scientists believe redistricting contributes to some of these outcomes, but there is a significant amount of research that casts doubt on the argument partisan gerrymandering is a principal cause of polarization in American politics—the

[27] https://freedomhouse.org/reports/freedom-world/freedom-world-research-methodology
[28] https://www.eiu.com/n/campaigns/democracy-index-2020/

dramatic polarization of the U.S. Senate furnishes crucial evidence in that regard McCarty, Poole, and Rosenthal 2009). Interestingly, the country's only non-partisan legislature, Nebraska's unicameral body, is also polarized. Here antagonistic legislative groups are galvanized by campaign contribution patterns and candidate recruitment processes that mirror states with formal partisan politics (Masket and Shor 2015).

In the American context, there are many other practices that vary considerably across states and are more integral to the concept of free elections than what is typically called a "partisan gerrymandering". These include rules related to voter access and election integrity such as registration and voter identification requirements, absentee and early voting rules, and the location and number of polling places. These freedoms are routinely regulated by state law and court decisions.

Freedom, moreover, infers choice. As a result, when assessing whether elections are free we should also consider the character of the ballot given to voters. Ballot access and candidate filing rules are crucial in this regard. So is the number of candidates on the ballot and the availability of accurate and useful information about each of them. If voters have very little freedom of choice in U.S. House and state legislative elections our electoral system is to blame. Much of the time they have only two alternatives, a Democratic or Republican candidate. Others desiring the label "Democrat" or "Republican" are forcibly eliminated from consideration by a primary and candidates from other parties are kept off the general election ballot by restrictive rules. Although the Libertarian Party has official standing in North Carolina, the only independent candidate to appear on a statewide election ballot here was Ross Perot in 1992.

What about "equal elections"? Each person has one vote to elect one legislator who has one vote in the legislature. More specifically, the existing restrictions on the redistricting process exist to ensure elections be equal. The choice of legislative candidates is the same for all voters in a district and, most importantly, the General Assembly must establish districts with equal or nearly equal populations. The law does currently tolerate tangible inequalities in elections, however. In the recent *Evenwel v. Abbott* case, the Supreme Court strongly advised states to conform to settled practice and draw their districts with equal population, not equal numbers of eligible voters.[29] Eligible individuals are also given different chances to vote by their registration status—you must be registered in order to vote. Other plausibly unequal treatment includes distance from the place of polling and the length of time it takes to vote once there.

Unequal outcomes are inherent to our winner-take-all or first-past-the-post single-member-districts electoral system—North Carolina cannot draw at-large or multi-member districts.[30] There is one winner in the election for each seat in the U.S. House and North Carolina House and Senate. If the election is contested, there is also at least one loser. The winner is selected by a plurality of voters in the district. The remaining voters who cast a ballot selected a loser.

I will return to the notion of "wasted votes" and the related frequently used quantitative indicator of partisan gerrymanders, the "efficiency gap", later. But I think it

[29] 136 S. Ct. 1120 (2016).
[30] The intent was largely to protect the political interests of minorities. The case that ended multi-member districts in North Carolina was *Stephenson v. Bartlett*, 355 N.C. 354 (2002).

should be noted the plaintiffs also talk about certain citizens having their votes "wasted" and imply they are treated unequally. Wasted votes are those cast for the losing candidates or the winning candidate above those needed to win, in other words the difference in votes received by the winner and the second-place finisher minus one. Wasted votes are intrinsic to our system.[31] It is not, therefore, citizens who waste or do not waste votes when they register their choice of candidates on the ballot. They are exercising a fundamental right. It is the parties who waste them by winning seats by large margins or losing seats by slim ones.

My response to the argument the district plans violate the North Carolina Constitution's provisions regarding "free speech" and "free assembly" is similar. Political scientists do not conceptualize partisan gerrymandering in terms of the suppression of speech or the ability to organize freely. According to the *Oxford Concise Dictionary of Politics*, "freedom of speech" is the "liberty to express opinions and ideas without hindrance, and especially without fear of punishment" and "freedom of association" is "the freedom of individuals to associate as an end in itself or with the view to pursuing common projects, e.g. churches, trade unions, political parties, and sporting clubs" (McLean and McMillan 2003, 208-9). When they study legal restrictions on political speech and organization in the American context, political scientists examine

[31] If the goal had been to eliminate wasted votes, through their Constitution the people of North Carolina would have adopted a system of proportional representation in which seat shares are a faithful representation of the proportion of total statewide votes each party received. If the plaintiffs' intent is to provide "Democratic voters" the "opportunity… to elect the candidates of their choice in the districts and/or clusters where they reside" (Verified complaint in *NCLCV*, p. 12) then they should desire plans with highly uncompetitive districts where each individual Democratic voter is very likely to select the winner.

matters such as campaign finance, candidate nomination procedures, rules regulating canvassing, rallies, and protests, media entities' compliance with the federal requirement they provide equal time to any opposing candidates who request it, and so on. State laws that unfavorably treat citizens who wish to organize or vote for third or minor parties, such as those shaping the electoral system and restricting access to the ballot, are perhaps the most important examples. There are no restrictions on North Carolina Democrats' ability to assemble in the way they exist for North Carolina Constitution Party or Green Party members. As of early 2021, those two parties were no longer formally recognized by the state as political parties, consequently stripping them of numerous organizational advantages state Democrats (and Republicans and Libertarians for that matter) enjoy.

V. Proportionality, Competitiveness, and the Properties of a "Partisan Gerrymander"

i. Method

In this section, I deploy my knowledge of the political science methodology used to explore partisanship and redistricting. I survey the academic literature and explain and evaluate various principles and techniques.

ii. Political Science and Partisan Redistricting

The "partisan gerrymander" or manipulation of the redistricting process to bring about unfair partisan outcomes is an abstract political science construct. The concept has evolved over several decades with the contributions of many academics.[32] It lacks a

[32] For a good overview, see Burden and Smidt (2020).

precise operational definition. It seems to have a number of elements, although there is no consensus as to what these are and several appear to contradict each other. Unless investigators make personal and arbitrary decisions as to what principles to apply, it is prohibitively difficult to undertake a comprehensive comparison of a district plan to both others and some absolute desired standard.

Political scientists have tried to systematize an intellectual approach to the partisan gerrymander. In their efforts to facilitate real-world evaluation of district plans, they have created a series of indicators that purport to permit analysts to gauge the extent to which one is gerrymandered. Measures are generally interested in detecting something called "partisan bias", a broad gauge of whether a party received more seats than it should have given some exogenous standard of acceptability. Some emphasize proportionality or "responsiveness".[33] Beyond that, however, the indicators vary greatly. Some suffer measurement problems.

iii. Proportionality and Competitiveness

The arguments of critics of district plans, including it seems to me the *Harper* and *NCLCV* plaintiffs, are demonstrative of the intellectual minefield that is this effort to identify a partisan gerrymander. They often assert district plans have two important

[33] Both partisan bias and responsiveness focus on the "seats-votes curve" or the proportion of seats and votes won by a party when the two pieces of data are plotted against one another. Partisan bias is only concerned with the proportion of seats won when we place a party at 50 percent of the vote (this must be estimated using a computer algorithm), models interested in proportionality look at the entire curve. In both cases, significant asymmetry in the left and right hand sides of the curve (that is either side of 50 percent of the vote) is interpreted as a sign of a gerrymander.

deficiencies: They produce outcomes in which the share of the legislative body's seats won by a party is not proportionate with its share of the aggregate statewide vote and/or they produce too many districts where there is little meaningful competition between the major parties' candidates. Many of these critics, including the plaintiffs here who on several occasions complain the enacted plans' lack of proportionality and too few competitive districts, want maps to exhibit both qualities.

Before I examine the problems of trying to have a district plan exhibit both proportionality and competitiveness, I should emphasize proportionality was not an objective of the designers of our electoral system. Disproportionate outcomes in terms of seats are a feature not a bug. I have a deep knowledge of the modern political history and elections of the nation I grew up in, the United Kingdom. It has similar political values as the United States and an identical first-past-the-post plurality system of single-member districts for elections to its House of Commons. In the most recent general election of December 2019, the Conservative Party won 56.2 percent of the seats to form the government (legislative majority) with 43.6 percent of the vote. The Labor Party was second, but its 32.1 percent of the vote gave it 32.2 percent of the seats. The Liberal Democrats who received 11.6 percent of the national vote in third place won 1.7 percent of the seats while the Scottish National Party's (SNP) 3.9 percent of the vote secured it 7.4 percent of the seats. Labor's main response has been to change its leader and resolve to recruit better candidates and campaign more skillfully in districts it was defeated, especially those it lost narrowly or whose seats its members had occupied in the previous parliament. The Conservatives do the same when they are out of government. The

Liberal-Democrats have not bemoaned redistricting, but continue their long-standing efforts within the political process to make the electoral system more proportional. The SNP has retained its traditional strategy of focusing on its home base in Scotland's 59 districts.

As a practical matter, proportionality is not that important to the representation of the parties in government anyway. Our electoral system is described as "winner-take-all" for a reason. It is explicitly majoritarian. In *Common Cause*, the Court paid particular attention to the plaintiffs' argument that the plan made it very difficult for the Democrats to win legislative majorities.[34] It understood that in the General Assembly, majority status is of critical importance and the majority party sees rapidly diminishing returns from winning each additional seat beyond 26 in the Senate and 61 in the House. This is because both bodies are hierarchically organized giving great power to the leader of the majority party and, unlike the U.S. Senate with its filibuster for example, prohibit meaningful minority party obstruction (Cooper 2008). Moreover, the proportional distribution of seats in the North Carolina U.S. House delegation matters little to the overall partisan composition of Congress. North Carolina has only 14 of the 435 districts.

A central problem for critics of district maps like the plaintiffs in *Harper* and *NCLCV* is that proportionality and competitiveness are often incompatible. By trying to increase one, you can reduce the other, but not always in predictable ways. To

[34] *Common Cause v. Lewis*, p. 313.

understand this theoretically, consider a hypothetical state where we assert 50 percent of its voters are Democrats and 50 percent Republicans. The voters are distributed across the state in such a way we can draw very different types of maps. We can draw a map for a 100-member legislative body to ensure perfect proportionality. In this case, the plan would have 50 solid (perhaps even near 100%) "Democratic" districts and 50 solid "Republican" districts. No contests would be competitive. Alternatively we can draw 100 competitive districts, each with roughly half of its voters Democrats and the other half Republicans. Here, however, even a small statewide uniform swing towards one of the parties could result in it winning a very large majority even if the aggregate vote was something like 53 percent to 47 percent in its favor.

There are numerous illustrations of the tension between proportionality and competitiveness in American elections. The 2012 congressional elections immediately following the 2010 redistricting cycle furnish a good example. Nobody claimed the Massachusetts U.S. House plan in the 2010 cycle was gerrymandered; indeed the Center for Public Integrity gave it a grade of 'A'.[35] But in 2012 Republicans won 30 percent of the statewide vote and only one contest could reasonably be considered competitive. The party's candidate lost that race and Democrats captured all nine of the state's seats. In Iowa, where the non-partisan redistricting process produced maps after the 2010 census that in the 2012 congressional election resulted in a statewide 50 percent to 47 percent advantage for Republicans and an even split between the major parties of the four seats,

[35] See, https://publicintegrity.org/politics/state-politics/massachusetts-gets-c-grade-in-2012-state-integrity-investigation/.

no race was decided by less than nine percentage points. In Illinois in 2012, five of its 18 congressional districts were decided by less than ten points (a reasonable indicator of competitiveness these days), but the Democrats won two-thirds of them with 57 percent of the vote.

iv. Often-Cited Political Science Methods Used to Indicate a "Partisan Gerrymander"

Three of the most prominent measures political scientists use to explore the potential gerrymandered qualities of a district plan demonstrate the real-world challenge of accounting for different features like proportionality and competitiveness in a single indicator. The "efficiency gap" developed by Nicholas Stephanopoulos of the University of Chicago Law School and Eric McGhee a political scientist at the Public Policy Institute of California is a frequently used analytical tool in the investigation of district maps popularized when litigants and judges discussed it in the Wisconsin case that eventually became *Gill v. Whitford* decided by the U.S. Supreme Court in 2018 (Stephanopoulos and McGhee 2018). It takes the absolute difference in the total number of Democratic wasted votes and Republican wasted votes in a district plan and divides it by the total number of votes cast in all districts. Stephanopoulos and McGhee (2018) estimate that any figure in excess of about .08 (or eight percent) constitutes a partisan gerrymander in favor of the party with the fewest wasted votes. But the efficiency gap tends to punish competitiveness if the outcomes break decisively for one party. This is because parties waste a large number of votes in losing close elections and very few in winning them. Proportionality can also be penalized. Take a hypothetical legislature with five districts containing 100 voters each, where Republicans win 60 percent of the

aggregate vote (300 votes) and three seats (60 percent). If the results were 85-15, 65-35, 65-35, 45-55, and 40-60 with Republican votes listed first, the efficiency gap would be .198 indicating a large gerrymander in favor of Democrats. Here the problem is parties waste a great deal of votes relative to their opposition when they win by large margins.

In the "mean-median difference" test, analysts subtract the median percentage recorded by a party's candidates in all of the districts in a plan from the mean percentage. When a party's median vote share is lower than its mean, it might be considered a victim of gerrymandering where its voters are unfairly concentrated (McDonald and Best 2015). But this approach does little to convey proportionality or competitiveness under many conditions, including in states where there is either little or a great deal of variance in the parties' performances across districts (Burden and Smidt 2020; Stephanopoulos and McGhee 2018).

The mean-median difference test is also particularly sensitive. In a study comparing different methods, Jonathan Krasno et al's (2019) analysis of the Wisconsin Assembly map drawn in 2011 using results from 13 statewide elections in the two cycles immediately preceding and following the redistricting revealed the mean-median difference was the method by far the most likely to indicate "substantial" partisan gerrymanders.

A third test, "lopsided margins", simply compares the mean margins of victory in all districts for each of the parties. The party with the larger margins of victory is most likely to have its voters concentrated and therefore subjected to a gerrymander. Analysts can then use a t-test to see if the difference in the means for the parties is statistically

significant (Wang 2016). This helps us get a grasp of competitiveness, but not always proportionality.

v. Summary

The value placed on proportionately and competitiveness by analysts of district plans, including the plaintiffs in *Harper* and *NCLCV*, highlight an important problem with judicial efforts to address partisan gerrymandering. Partisan gerrymandering is an abstract and complex concept that defies clear standards suitable for decisive intellectual analysis by political scientists. The reality of a first-past-the-post electoral system with single-member districts make it prohibitively difficult to discover districts that maximize both proportionality and competitiveness using available statistical techniques. Map-drawers, who are generally not political scientists, therefore often find it difficult to know which tools to use when evaluating competing plans. They discover their attempts to promote one desired principle like proportionality often undermine their efforts to promote another like competitiveness. My understanding of the social science of identifying partisan gerrymanders does not make me question it as derisively as Chief Justice John Roberts when he described the efficiency-gap measure as "gobbledygook" in oral arguments during *Whitford*. However, I believe even if judges think they have the power to reject maps drawn by the states on the basis that they constitute a partisan gerrymander, the objectives of litigants are often too broad and conflicted and the tools we have to analyze district plans too numerous, complex, and problematic to provide necessary clear and satisfactory direction.

VI. Additional Conceptual and Analytical Considerations

i. Method

In this section, I assess "baselines" that permit meaningful evaluation of district plans. To do this, I use my knowledge of North Carolina political history and survey the political science literature on methods.

ii. The Clustered General Population

The difficulty of generating transparent and objective standards for what constitutes a partisan gerrymander in the opinion of political scientists is relevant to this section as well. Here, I explicitly address the issue of what "baselines" to use or, in other words, what assumptions we should take into the exercise of constructing and evaluating district plans.

The first task is to account for the real world. Whether the issue involves general redistricting criteria like compactness, contiguity, and the maintenance of communities of interest, VTDs, or municipalities, or generally understood characteristics of partisan gerrymanders such as disproportionality or a lack of competitiveness, it is fair to ask not how any potential plan compares to an absolute standard but the "state of nature" or what we might call the "natural gerrymander". North Carolinians are spread unevenly within an oddly-shaped state. Some counties, communities, and VTDs are relatively small, others are quite large. Some are densely populated, others sparsely populated. So, for example, when we talk about a plan's performance with regards compactness, it is important to note the extent to which dividing the state into 14, 50, or 120 evenly populated chunks mitigates against the principle. Many observers use the Polsby-Popper measure of compactness which

reports results on a scale of 0 to 1. The congressional, state House, and state Senate plans enacted by the state legislature have Polsby-Popper mean scores of .30, .35, and .34 respectively. Is this unreasonably different from the state of nature? It is impossible to know, but from a basic examination of the three maps by someone with an understanding of the location of North Carolina's urban and rural areas they look, with a few plausible exceptions, quite compact.[36]

iii. The Partisan Clustering of the Voting-Age Population

What is more, Democratic and Republican voters are clustered. Democrats tend to live with other Democrats and Republicans with other Republicans. Democrats dominate the cities, Republicans small towns and rural areas of the state. Political scientists have various theories about why this is so. It could be the product of people with similar demographic characteristics like income, education, or race living together or people being persuaded to agree with their neighbors or moving to a place with more agreeable neighbors (Levendusky 2009; Rodden 2019). Regardless, the phenomenon poses significant challenges to legislators.

Published research demonstrates the problem. In a recent analysis of North Carolina, Gimpel and Harbridge-Yong (2020) reveal conceivable racial, occupational, geophysical, and sociocultural communities of interest tend to be homogenous in their partisan affiliations. To maintain many of them you must "pack" Democratic or Republican voters.

[36] There is another different but simpler measure of the compactness called the Reock test which essentially looks to see what proportion of the area of a circle drawn around its perimeter a district occupies.

iv. The Use of Election Data to Identify Democratic and Republican Voters

The second question regarding the establishment of baseline assumptions required to evaluate a district plan is the identification of Democratic and Republican voters. Analysts have sensibly moved away from using party registration data because of the large number of unaffiliated voters and the reality that the act of registering to vote is very different from that of casting one. So, although the criteria adopted by the North Carolina House and Senate redistricting committees in 2021 explicitly prevented legislators from using "election data", we, as observers, have the luxury of election results. But which ones should we use? Many, including the plaintiffs in these two cases, utilize recent statewide contests as their benchmark. They take the precinct-level returns from these elections and superimpose the enacted plans on them to determine hypothetically how many seats each party would receive.

Statewide elections for different offices or held at different times, even if observations are only two or four years apart, can produce significantly different outcomes. Votes are not fixed. The candidates, campaigns, office sought after, and contemporaneous political conditions mean voters do not consistently reveal themselves as Democrats or Republicans since many split their votes between the parties. In 2020, for example, Gov. Roy Cooper, a Democrat, beat Republican Lt. Gov. Dan Forest by 4.5 percentage points. In the presidential race that year, President Donald Trump the Republican defeated his Democratic opponent, former Vice President Joe Biden, by 1.3 percentage points. There was significant talk of "Cooper-Trump" voters, one North Carolina political scientist estimated roughly eight to

twelve percent said they would vote this way shortly before the election.[37] Turnout can also vary considerably and many voters participate in only one or a few of the elections used for analysis. When measured as a proportion of registered voters, turnout increased six percentage points over 2016 in the 2020 North Carolina election for president. Turnout also varies geographically. Eighty percent of registered voters in Wake County cast a ballot in 2020, only 62 percent of their counterparts in Robeson County did.

Research on Ohio and Wisconsin, two states at the epicenter of redistricting battles, demonstrates the problem of what election(s) to use. The Krasno et al (2019) paper cited earlier revealed that, in addition to the choice of diagnostic method, the choice of election had a material effect on whether an analyst could reasonably describe the 2010 Wisconsin state district plan as a gerrymander or not. Redistricting experts Micah Altman and Michael McDonald examined the competiveness of various Ohio congressional district plans drawn after the 2010 census. "District competitiveness", a component of a formula reformers used to judge the maps somewhat arbitrarily set at 55-45 or less, provided diverse outcomes depending on the baseline election data used (Altman and McDonald 2017).

This problem also afflicts a recent approach to the analysis of district plans I did not consider in the previous section. Armed with sophisticated software, researchers can now use computer algorithms to generate large numbers of alternative maps by combining VTDs that are contiguous and equal in population. This method can produce thousands of maps that, although generally ignoring criteria such as compactness and the maintenance of other

[37] This was Christopher Cooper of Western Carolina University (McElroy 2020).

jurisdictions like counties and communities of interest, are drawn without knowledge of partisan voting patterns. Any particular map is said to demonstrate an intolerable partisan gerrymander if it produces returns that are distant from those of the mean or median of all the computer-generated maps (Chen and Rodden 2015).[38]

Finally, the problem of baseline election results also afflicts *post facto* analyses of district plans. Goedert (2017) has shown that plans considered partisan gerrymanders often produce more competitive elections than those considered "bipartisan". This is the result of the so-called "dummymander", where the majority party in the state legislature enacts plans in which its voters are distributed so thinly across districts that although it might enjoy considerable advantages in theory and the short-term, the minority benefits in the longer term, especially in the aftermath of "wave" elections. Grofman and Brunell (2005) argue this is what happened to the 1990 Democratic "gerrymander" of North Carolina congressional districts. From the perspective of later in the decade, therefore, a plan that originally seemed biased in favor of the state legislative majority party can appear biased toward the opposition. It is not, therefore, what is usually called a partisan gerrymander.

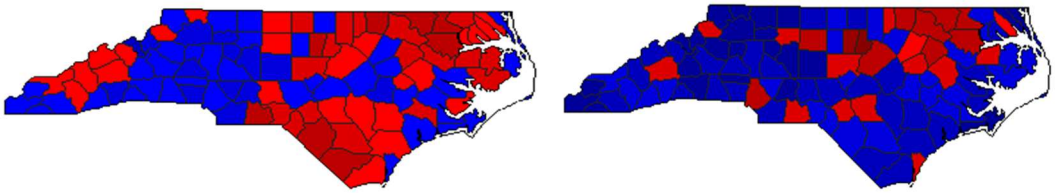
This concern with the choice of baseline elections motivated Stephanopoulos and McGhee's efficiency gap. They claim a principal strength of their method is that it does not use exogenous election results but the outcomes of the actual legislative contests fought using the plan in question. This is not without problems, however. It is difficult to know

[38] This was the method by which the North Carolina Senate drew state legislative maps following the order from the Court in *Common Cause*. It took five simulated maps and selected between them by lottery.

what to do with uncontested races when calculating statewide party vote totals. Moreover, because candidates win their seats with a plurality of the vote, they have no incentive to maximize. This undermines our capacity to understand the true statewide Democratic and Republican votes under a plan.

v. The Concept of "Community"

One last point regarding analytical challenges. The plaintiffs in *NCLCV* refer repeatedly to the belief that legislators' district plans should have maintained "communities" of Democratic voters and, especially, Black citizens. What precisely constitutes a "community of interest" for the purposes of redistricting has long been disputed. The term is unavoidably vague. Communities are ill-defined and surely many of them overlap or are nested within others. It is therefore impossible to understand whether the plaintiffs' optimized maps are really an improvement in the number of communities maintained, regardless of the central feature of such communities.



VII. A Recent History of North Carolina Party Politics

i. Method

In this final section, I deploy my knowledge of and survey the academic literature on party politics, particularly in North Carolina.

ii. The Changing Geographic Character of North Carolina Democratic and Republican Voters

The two figures below show county returns for the competitive 1992 (left) and 2020 (right) presidential elections in North Carolina. The data are taken from uselectionatlas.org, a highly reputable source of presidential election data. The counties won by the Democratic candidates (Bill Clinton and Joe Biden) are marked in red (unfortunately the site prefers to give the parties the colors opposite to those assigned to them in today's popular culture) and those won by the Republicans (George H.W. Bush and Donald Trump) in blue. Deeper shading denotes a larger margin of victory. Bush beat Clinton in North Carolina in 1992 by 0.8 percentage points (Ross Perot won 13.7 percent of the vote) and Trump beat Biden in 2020 by 1.3 percentage points.

Clinton (red) v. Bush (blue), 1992 Biden (red) v. Trump (blue), 2020

Note the significant differences. Some areas, such as the counties in northeastern North Carolina and the foothills surrounding Charlotte voted for the same party in both elections, but most of southeast North Carolina became Republican. This is also true of a lot of rural counties in the center and far western part of the state. At the same time, urban areas became more Democratic. In 1992, Bush won Forsyth and Mecklenburg counties and narrowly lost Wake. Trump was defeated in all three in 2020, in Mecklenburg and Wake by around 30 percentage points.

The contrasting figures demonstrate a significant change in North Carolina's political geography. Democrats used to do well in rural areas, especially in the eastern part of the state. Republicans were competitive in urban and suburban areas. That is no longer true. The transformation is not the result of redistricting. Neither, clearly, were the significant gains Republicans made in congressional and state legislative seats in North Carolina in the 1990s and first decade of this century.

How does this happen? Much of it is a function of slow social and economic forces that only reveal themselves over several decades or redistricting cycles. Most individuals vote for candidates of the party with which they identify—according to 2020 exit polls around 95 percent of self-proclaimed Democrats and Republicans in North Carolina voted for the presidential candidate of the party they linked themselves to. But it can also be explained by choices that parties and their leaders, candidates, and activists make. North Carolina's population is changing rapidly with large numbers of newcomers entering the state annually, the state grew by about nine percent or 850,000 people between 2010 and 2018. They are ripe for socialization into its politics. Today, North Carolina has about 2.3 million unaffiliated voters (roughly a third of the total) whose allegiances are up for grabs.

The Shor-McCarty (Shor and McCarty 2011) measures of state legislative party ideology cited earlier, moreover, reveal that between 2008 and 2018 the median North Carolina House Democrat moved .215 points to the left and the median Senate Democrat .008 points to the left. At the same time research showed North Carolina public opinion

to be moving in the opposite direction (Berry et al 1998).[39] Other research suggests Democratic national elites are today to the left of Democratic voters (Furnas and LaPira 2021). Decisions made by the parties' organizational leaders, elected officials, and activists have significantly contributed to these developments.

Candidates are certainly captive to the reputation of the party whose label they must run with on the ballot (Grynaviski 2013). However, it is also true voters are responsive to candidates' positions on particular issues and their skills as campaigners.[40] They also engage in spatial voting or the exercise of choosing the candidate they feel is closer to them ideologically.[41] On balance, this extensive research suggests that parties can greatly influence primary outcomes and by nominating candidates suited to their political surroundings can markedly improve their chances of winning in a district (Hassell 2017). Alternatively, party leaders and motivated activists can leave in place internal rules and procedures and go to the courts to move district lines to benefit their candidates so they may continue to select the same individuals to represent their party in general elections.

VIII. Conclusion

There are two analytical approaches to the investigation of the phenomenon typically called a "partisan gerrymander". Researchers can examine individual districts or the larger

[39] Updated data can be found at: https://rcfording.com/state-ideology-data/
[40] This is a huge literature. A good example is Herrnson and Curry (2011).
[41] This is also a large literature. An influential work is Jessee (2012).

district plan. I have chosen the latter. I have done this for two reasons. First, it is more consistent with my expertise. I am not a mathematician or computer scientist like some of the plaintiffs, but I have spent over two decades observing and writing about American and North Carolina politics and have broad and deep understanding of the complex issues and academic literature on state legislatures, elections, and redistricting. Second, the considerable time constraints placed on me prohibits a detailed district-by-district statistical analysis of the congressional, state Senate, and state House plans.

In the first section of my report, I argue that the process used by the North Carolina General Assembly to create and enact the district plans was consistent with the provisions of the Constitution of North Carolina that speak directly to redistricting. The second section covers my evaluation of the plaintiffs' claims that the plans violate political science's understanding of free elections, equal protection, freedom of speech, and freedom of assembly. Next, I explain the difficulty of identifying plans afflicted with a "partisan gerrymander", the problems with the methods used in these types of studies, and the contradictions between various characteristics—namely proportionality and district-level competitiveness of the parties—many would like to see maps exhibit. In the fourth section, I address additional issues with conceptualization and analysis, particularly those of baseline assumptions. I conclude with a brief look at the state political parties and how they enjoy agency in general elections the critics of district plans imply they do not.

The plaintiffs in *NCLCV* claim to have "harnessed the power of high-performance computers, and employed cutting-edge computational methods and resources, to draw

alternative maps".[42] They claim their plans "avoid the partisan gerrymandering and racial vote dilution that mark the Enacted Plans (those approved by the state legislature), while also improving on the Enacted Plans' compliance with the laws and legitimate policies governing redistricting in North Carolina." The plaintiffs state the General Assembly's plans should be rejected because they "cannot withstand the scrutiny of math and science".[43]

I believe as an expert in the field of political science, the plaintiffs in *NCLCV* have much less command of other subjects more central to redistricting. Their approach glosses over the challenges posed by the evaluation of district maps for properties of partisan gerrymandering. There is no clear consensus among political scientists on the meaning of a partisan gerrymander as a political concept. The choice of baselines necessary for this analysis is a contentious exercise. General and voting-age populations live in such ways as to give states features that contribute to what many might call a natural gerrymander. The preferences of individual voters are often undiscernible, but when they do present themselves they can be fluid and vary temporally and across offices. Candidates and political parties are not helpless in structuring voters' behavior. We understand a partisan plan is measured along several dimensions, but we cannot fully agree on the importance to assign to each one and therefore what is the best way to assess a district map. We also know that efforts to maximize along different dimensions can sometimes be complementary and at other times incompatible.

More importantly, I believe based upon my analysis of North Carolina's political history, the state's redistricting tradition compels the enacted plans. The question is not whether the

[42] Verified complaint in *NCLCV v. Hall*, p. 62.
[43] Verified complaint in *NCLCV v. Hall*, p. 4.

plaintiffs' plans are in some way superior. It is whether the enacted plans are lawful. The process the North Carolina General Assembly used was consistent with the framework of redistricting in the state, a bar that is low given the uniquely considerable latitude the state's statutes and constitution give the legislature to consider and approve maps. Political concepts cited by the plaintiffs have little-to-nothing to do with common understandings of the practice of redistricting as it is done in North Carolina or the United States. Those who want different redistricting outcomes should work through the political process to obtain them. The people can elect different legislators or alter other critical features of our politics that make the results of legislative elections so distasteful to them. The people can change the law to provide us with a new method of drawing single-member districts such as the independent non-partisan redistricting committee of House Bill 69 that, in 2019, gathered 66 co-sponsors from both parties. Or, alternatively, the people can enact a thorough overhaul of their electoral system by amending their constitution. For the courts to make such a change is inconsistent with the principle of separation of powers or the manner in which the state's constitution has historically been applied.

STATE OF NORTH CAROLINA

COUNTY OF WAKE

IN THE GENERAL COURT OF JUSTICE
SUPERIOR COURT DIVISION
21 CVS 015426
21 CVS 500085

NORTH CAROLINA LEAGUE OF CONSERVATION VOTERS, et al.,

Plaintiffs,

vs.

REPRESENTATIVE DESTIN HALL, in his official capacity as Chair of the House Standing Committee on Redistricting, et al.,

Defendants.

REBECCA HARPER, et al.,

Plaintiffs,

vs.

REPRESENTATIVE DESTIN HALL, in his official capacity as Chair of the House Standing Committee on Redistricting, et al.,

Defendants.

EXPERT REPORT OF DR. JEFFREY B. LEWIS

Pursuant to the North Carolina Rules of Civil Procedure and the Case Management Orders of the Court in the above-captioned matter, I, Jeffrey B. Lewis, provide the following written report:

1. I am a Professor of Political Science at the University of California, Los Angeles (UCLA). I am also the past department chair of UCLA's political science department and past president of the Society for Political Methodology. I have been a member of the UCLA faculty since 2001. Prior to that, I was an Assistant Professor of Politics and Public Affairs at Princeton University from 1998 to 2001. I earned my B.A. in Political

NCLCV v. Hall
21 CVS 15426
LDTX109

Science and Economics from Wesleyan University in 1990 and my Ph.D. in Political Science from the Massachusetts Institute of Technology (MIT) in 1998. My main area of specialization is quantitative political methodology with a focus on making inferences about preferences and behavior from the analysis of voting patterns in the mass public and in legislatures. I have published on the topic of ecological inference – the challenge that arises when one wants to know how individuals of different types voted in an election, but one can only observe electoral data aggregated to the precinct, county or other summary level. A true, accurate, and complete copy of my curriculum vitae is attached as Exhibit A.

2. I have previously been retained as an expert in relation to nine court cases: one involving allegations of voting machine failure in Florida (Jennings v. Elections Can-vassing Commission of State of Florida), four involving claims of minority vote dilution in California (Avitia v. Tulare Local Healthcare District; Satorre et al. v. San Mateo County Board of Supervisors et al.; Ladonna Yumori-Kaku v. City of Santa Clara); and Pico Neighborhood Association and Maria Loya v. City of Santa Monica), one involving claims of minority vote dilution in Texas (Perez, et al. v. Abbott, et al.), one involving claims of minority vote dilution in North Carolina (Common Cause, et al. v. Lewis), one involving claims of minority vote dilution in Washington (Aguilar v. Yakima County), and one involving the compactness of legislative districts in Illinois (Radogno et al v. Illinois State Board of Elections, et al.). I testified as an expert in the cases of Ladonna Yumori-Kaku v. City of Santa Clara and Pico Neighborhood Association and Maria Loya v. City of Santa Monica.
3. I am being compensated at a rate of $550/hour.
4. In the attached tables and spreadsheet, at Exhibit B, I present summaries of the results of North Carolina general and Democratic primary election contests held in 2014, 2016, 2018, and 2020. In particular, I consider how each contest would have turned out if only the votes of those residing in each current and in each enacted State House, State Senate, and Congressional district had been counted.
5. This exercise allows us to consider the voting strength of the Black voters in each existing and proposed legislative district.

6. For each of these "reconstituted" election contest in each district, I used weighted ecological regression (ER) to estimate the degree of Black voter cohesion and non-Black voter crossover (hereafter "white crossover"). In some cases, the number of voting precincts available for the analysis was too small or Black share of voters was too small to meaningfully apply ER. I omit such contest-district combinations.
7. I further narrow the set of contests to partisan races for executive and legislative offices. And, I only "reconstitute" a given contest within a given district if the data indicate that at least 80 percent of the voters in the given election who resided the district, voted in the given contest.
8. I identify the "Black-preferred" candidate in each contest as the candidate estimated by ER to have received the largest share of Black votes in the given contest or, in the case of single-candidate elections, that candidate if they are a Democrat (single-candidate elections without a Democrat are considered not to have a Black-preferred candidate).
9. I also note whether each candidate is Black and whether each contest includes at least one Black candidate.
10. The tabulations and estimates are based on datasets that I downloaded from the North Carolina Board of Elections (SBOE) website with the exception of a crosswalk between the current and enacted legislative districts and voting precincts used in the 2014, 2016, 2018, and 2020 elections and estimates of Black Voting-Age population (VAP) by district that were provided by Clark Bensen of POLIDATA.
11. The race of each candidate was determined by looking up each candidate listed in the SBOE's candidate list datasets on the North Carolina voter list (also from the SBOE). In some cases, a candidate's race could not be determined because: their legal name matched no voter on the voter list, no race was indicated on the voter list, or they were matched to several voters of different races on the voter list. In total, over 1,800 Black candidates were identified (including many competing in contests not subsequently analyzed for the reasons described above).
12. The demographic composition of voters from each precinct needed to perform ER was derived by merging vote history records from the SBOE to the precinct election returns. Because some counties do not allocate "One Stop" and absentee votes back to precincts (and for other reasons), not all voters can be matched to a voting precinct and not all

precincts can be placed in legislative districts. Where One Stop and absentee ballots were allocated to regular voting precincts, the voting and demography within each precinct was broken down by voting method when performing ER. This is possible because the vote history records (which are used to estimate the fraction of voters in each precinct who were Black) are broken down by voting method (as sometimes are the election returns within each precinct). When a county reported One Stop or absentee votes without allocating them to precincts and where feasible, I aggregated the One Stop and absentee votes in the election returns and the One Stop and absentee voters into a single One Stop and a single absentee precinct. Given the need to break down the votes by legislative district, this was only feasible in counties that fall entirely within a single State House, State Senate, or Congressional district.

13. The attached tables summarize the reconstituted elections analysis. For each district, the tables show averages of many of the quantities described above as well as: the Black-preferred candidate "win rate" (the fraction of Black-preferred candidates who would have won if the contest had only been held in the given district); the percent of Black-preferred candidates who were Democrats; the average number of major-party candidates in the reconstituted contests; the average fraction of voters who were Black; and, an estimate of the average minimum fraction of those voting in the district that would have had to be Black in order for the Black-preferred candidate to expect to get at least 50 percent of the vote (based on the ER estimates and only applied in contests involving two major-party candidates).
14. The tables present separate results for primary and general elections. Separate tallies are also presented that include only those contests that included at least one Black candidate.
15. The attached spreadsheet *minority_preferred_candidates.csv* identifies the minority-preferred candidate in each of the reconstituted contests considered. It includes the following fields:
    a. *district*, an identifier of the district including its chamber, plan, and number in which the contest is reconstituted.
    b. *election_date*, the date of the election
    c. *election_type,* primary or general
    d. *contest,* the electoral contest being reconstituted.

e. *minority_preferred_candidate,* the name of the minority preferred candidate (as identified by ER).

f. *minority_preferred_party,* the party of the minority-preferred candidate.

g. *cand_is_black,* whether the Black-preferred candidate is Black.

h. *has_minority_candidate,* whether the contest included a Black candidate.

i. *wonlost,* identifies the Black-preferred candidate as a "winner" or "loser" of the reconstituted election (highest-vote getter).

j. *pct_vote,* percent of vote won by the Black-preferred candidate in the reconstituted contest.

k. *ER.pct_black,* average share of voters in the ER analyses who were Black.

l. *ER.black_cohesion,* weighted Ecological Regression (ER) estimates of support for Black-preferred candidate among Black voters in the reconstituted election.

m. *ER.white_crossover,* weighted Ecological Regression (ER) estimates of support for the Black-preferred candidate among white (non-Black) voters in the reconstituted election.

n. *ER.black_pct_needed_for_majority,* Uses the ER estimates to infer the minimum share of the voters in the reconstituted election that would generate majority support for the minority-preferred candidate in the reconstituted election. Note that this is the estimated average percentage of Black voters in the contest needed for a majority, not the percentage of Black VAP existing in the district.

o. *Coverage,* the ratio of the total votes cast in the reconstituted election to the most votes cast in any reconstituted contest in the same district and election expressed as a percentage. In many cases, eligibility to participate in a particular contest will only partially overlap with the district in which the reconstituted election is considered. Because the area of overlap may encompass a set of voters who are not representative of the voters a district as whole when the overlap is small, I consider only contests for which this overlap or "coverage" exceeds 80 percent (for example, this include contests for statewide offices).

p. *number_of_candidates,* The number of major-party candidates in the contest.

16. This analysis goes beyond Professor Dunchin's analysis to consider not just 4 primary and 4 general election contests, but over 420 individual contests including over 190 that

include a Black candidate. These contests include both endogenous and exogenous contests for legislative and executive offices ranging from a Recorder of Deeds to the US President. The analysis also expands on Professor Duchin's analysis by estimating the rate of support of each candidate in each contest within each district to capture variation in Black voter cohesion and white cross-over voting across the districts (whereas Professor Duchin estimates a single rate of cohesion and of cross-over voting statewide for the 8 contests that she considers).

17. Using (without endorsing) Professor Duchin's definition of "effective" Black districts (greater than 75 percent Black preferred win rate in races with minority candidates combined with greater than 25 percent Black voting-age population), an analysis of this larger set of election contests identifies as "effective" the enacted districts that Professor Duchin enumerates (with the exceptions of State Senate District 12 and State House District Districts 066 which do not exhibit a 75 percent win rate in the larger dataset and House District 039 for which too few data precinct points were available to apply ER to identify the Black-preferred candidates). It also identifies as "effective" by Duchin's definition as many as seven additional State House districts and four additional State Senate districts. *See* Table 1.
18. Relaxing Professor Duchin's requirement that an "effective" district must have more than 25 percent Black voting-age population, my more expansive analysis suggests the existence of one additional "effective" Congressional district, four additional "effective" State House districts, and two additional "effective" State Senate districts.
19. Further relaxing the definition of "effective" to those districts in which the Black preferred win rate exceeds 66 percent suggests the existence of seven more "effective" State Senate districts and 16 additional "effective" State House districts. *See* Table 1.
20. Increasing the set of contests considered to include contests without Black candidates further lifts the number of apparently "effective" districts under Duchin's definition.
21. Only two of the "effective" districts (by any of the above definitions) are majority Black VAP. Districts with Black-preferred win rates of over 75 percent in the reconstituted elections include two districts with Black voting-age populations below 7 percent and five districts with Black voting-age populations below 20 percent.

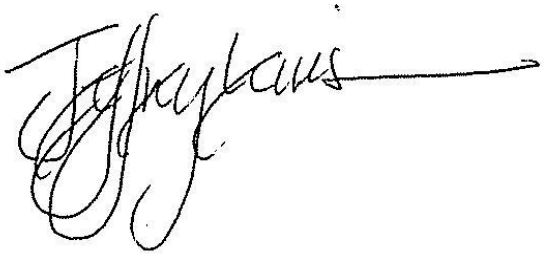

Table 1 – Duchin "Effective" Black Districts in Enacted Plans

	House	Senate	Congress
Number of "Effective" Black Districts in enacted plans using Duchin definition	29	12	2
Number of "Effective" Black Districts in enacted plans using Duchin definition but relaxing 25% BVAP and applying win rate of 66%	49	21	5
Number of "Effective" Black Districts in enacted plans using Duchin definition but relaxing 25% BVAP and applying win rate of 50%	88	40	11

22. In no district, enacted or in 2020, does it appear that a majority Black VAP is needed for that district to regularly generate majority support for minority-preferred candidates in the reconstituted elections.
23. Black voters constitute a powerful political force in North Carolina electoral politics because of their numerical size and highly cohesive voting as well as the sizeable white (non-Black) cross-over vote for Black-preferred candidates that exists particularly in areas of the state in which Black voters are concentrated. As Professor Duchin documents, contemporary Black voting power in North Carolina is such that it is now even possible to draw a set of districts in which Black voters would have effective control (by her definition) of a share of the state's legislative districts that meaningfully exceeds the size of the Black population.
24. I reviewed the "Addendum to Primary Expert Report of Jonathan C. Mattingly, Ph.D." Dr. Mattingly appears to have reconstituted election results in different county cluster options and identified Black VAP in those same clusters. Dr. Mattingly's Addendum is not a racially polarized voting analysis.

CERTIFICATION

I certify that the statements and opinions provided in this report are true and accurate to the best of my knowledge, information, and belief.

US Congressional roll call voting and related data, 1789–2021: Provides data on every roll call vote ever taken in the United States Congress. See `https://voteview.com`.

US Congressional District Boundaries, 1789–2017. Detailed GIS descriptions of every district in US history (with Brandon DeVine (UCLA), Lincoln Pritcher (UCLA), and Ken Martis (UWV)). See `http://cdmaps.polisci.ucla.edu/`.

109th – 114th Congress Data Project. UCLA. Webpage allows download of up to the hour roll call voting matrices for the current US Congress [Now included in the Voteview project].

California Roll Call Project. UCLA. Collection of roll call voting data from the California Assembly from 1850 to the present. Ongoing (with Seth Masket).

Crisis Bargaining Data Base. UCLA. Codings of post-World War I international crises outcomes in terms of a simple game theoretic model of coercive diplomacy (supported by NSF-SBS-0241647) (with Ken Schultz).

Record of American Democracy Project Harvard University. One of several project leaders. Summer 1995.

University Service

Chair: Executive Committee, Faculty of Letters and Science, UCLA (September 2019–Present)

Vice Chair: Executive Committee, Faculty of Letters and Science, UCLA (2018–2019)

Member: Executive Committee, Faculty of Letters and Science, UCLA (2017–2018); Council on Academic Planning and Budget, UCLA (2019–Present); Classroom Advisory Committee, UCLA (2018–2020); Pathways to Commencement Task Force, UCLA (2013–2014).

Professional Experience

President: Society for Political Methodology (2015–2017).

Vice President/President elect: Society for Political Methodology (2013–2015).

Co-editor: *The American Political Science Review* July 2008–July 2011; *The Political Methodologist*, the APSA Methodology section newsletter. 2004–2007 (with Adam Berinsky and Michael Herron).

Editorial Board Member: *Journal of Politics*, 2005–2008; *Political Analysis* 2005–present.

Panelist: National Science Foundation ad hoc peer review panels (June 2004, February 2008, October 2010); National Science Foundation Political Science Panel (2009–2010).

Departmental review visiting committee member: University of Colorado, 2013; London School of Economics, 2015; University of Michigan, 2015.

Nominations committee member: American Political Science Association, 2011–12, 2012–13.

Program committee member: American Political Science Association Annual Meetings 2003, Political Methodology division head.

Anonymous Referee: *American Political Science Review*, *American Journal of Political Science*, *Journal of Law and Economics*, *World Politics*, *Political Analysis*, *Legislative Studies Quarterly*, *Sociological Methods Review*,

Journal of Politics, *Journal of Theoretical Politics*, and *Political Behavior*, *Perspectives on Politics*, *Public Opinion Quarterly*, *Journal of Political Economy*.

Discussant/Panel Chair Political Methodology Conference (1997, 2004, 2005, 2015), Midwest Political Science Association meetings (1998, 2005, 2006). American Political Science Association meetings (1998, 2002, 2003, 2006, 2010, 2016). Public Choice Society (1996, 2002)

Work Experience

Polimetrix Palo Alto, CA
Director of Statistics, 2003–2007.

Office of Technology Assessment, U.S. Congress Washington, DC
Research Analyst, Industry Technology and Employment program. October 1990 – August 1992.

Selected Invited Lectures

American Politics Seminar, Political Science Department, Columbia University, 1998

Political Economy Seminar, Political Science Department, Michigan University, 1999

Political Economy Seminar, Graduate School of Business, Stanford University, 1999

Political Economy Seminar, Politics & Economics Departments, Princeton University, 1998

Southern California Methods Program, UC Riverside, November 2001.

Ideal-Point Estimation Conference, Washington University St. Louis, September 2002.

American Politics Seminar, Political Science Department, Yale University, 2003.

Political Economy Seminar, Politics & Economics Departments, Princeton University, Spring 2004.

Political Economy Seminar, Politics Department, Massachusetts Institute of Technology, Spring 2004.

Empirical Implications of Theoretical Models Program, Washington University, St. Louis, June 2004.

Multilevel Methods Conference, Center for the Study of Democratic Politics, Woodrow Wilson School of Public and International Affairs, Princeton University, October 2004.

Empirical Implications of Theoretical Models Program, University of California Berkeley (one week module co-taught with Kenneth A. Schultz). June 2005.

Roll Call Voting Conference, Department of Political Science, University of California, San Diego. May 2006.

Measures of Legislators' Policy Preferences and the Dimensionality of Policy Spaces Conference Department of Political Science, Washington University, St. Louis. November 2007.

Causal Inference. Business School. University of Southern California. June 2010.

How to Scrape Web Pages. Summer Methods Program. Department of Sociology. Stanford University, July 2010, 2011, 2012, 2013, 2014, 2015.

Lectures on Ecological Inference. Summer Methods Training Program, Academia Senica, Taipei, Taiwan. July 2010.

Applied Statistics Workshop. Department of Government. Harvard University, April 2011.

Methods Workshop. Department of Political Science, Stanford University. June 2011.

Conference on "Political Representation: Fifty Years After Miller & Stokes." Vanderbilt University, March 2013

Center for the Study of Democratic Politics (CSDP) Workshop, Princeton University, April 2015.

Ideal Point Models in Political Science Workshop, MIT, April 2015.

Interdisciplinary Seminar in Quantitative Methods (ISQM) Workshop, University of Michigan, September 2015.

Political Economy Seminar, Graduate School of Business, Stanford University, April 2019,

Exhibit B

STATE OF NORTH CAROLINA COUNTY OF WAKE	IN THE GENERAL COURT OF JUSTICE SUPERIOR COURT DIVISION 21 CVS 015426
NORTH CAROLINA LEAGUE OF CONSERVATION VOTERS, et al., REBECCA HARPER, et al., Plaintiffs, vs. REPRESENTATIVE DESTIN HALL, in his official capacity as Chair of the House Standing Committee on Redistricting, et al., Defendants.	*Consolidated with* 21 CVS 500085

AFFIDAVIT OF MICHAEL BARBER

Now comes affiant Michael Barber, having been first duly cautioned and sworn, deposes and states as follows:

1. I am over the age of 18 and am competent to testify regarding the matters discussed below.

2. For the purposes of this litigation, I have been asked by counsel for Legislative Defendants to analyze relevant data and provide my expert opinions.

3. To that end, I have personally prepared the rebuttal report attached to this affidavit as Exhibit A, and swear to its authenticity and to the faithfulness of the opinions.

FURTHER THE AFFIANT SAYETH NAUGHT.

NCLCV v. Hall
21 CVS 15426
LDTX110

Executed on 28 December, 2021.

Michael Barber

Michael Barber

STATE OF FLORIDA

COUNTY OF PINELLAS

Sworn to and subscribed before me by online notarization this 28th day of December, 2021, by MICHAEL BARBER, who appeared by way of two-way audio/video communication technology, and he provided his Utah driver's license as identification.

1 Introduction and Qualifications

I have been asked by counsel for the Legislative Defendants to analyze and respond to reports submitted by Drs. Magleby, Pegden, Mattingly, and Cooper with regards to their analysis of North Carolina's recently enacted redistricting plans for the General Assembly (the "Enacted Plans").[1]

I do this in the following ways. First, I provide a summary of their conclusions as well as comparisons between their main results and those I produced in my original report. I also consider the specific analysis they produce for several county groupings that are singled out in their reports for additional scrutiny. I also define a measure of substantive significance to determine the degree to which the Enacted Map differs from Dr. Pegden's simulations and subsequent expected seats analysis.

The results show that there is often not agreement, even among the plaintiffs' experts, as to whether or not a county grouping's districts constitute a partisan outlier. In some cases the simulations produced by different experts come to different conclusions, and in other cases some of the experts assert an extreme partisan gerrymander, but in that same grouping the map proposed by the North Carolina League of Conservation Voters (NCLCV Map) exhibits the same qualities as the Enacted Map.

Based on the evidence and analysis presented below, my opinions regarding these reports studying the North Carolina General Assembly can be summarized as follows:

- There is significant agreement between Dr. Magley's simulation results and those produced in my original report with regard to the number of seats carried by Democrats in both the simulations and and the Enacted Plan despite some differences in our particular simulation methods.

- However, Dr. Magleby does not present county grouping by county grouping analyses,

[1]Due to the incredibly tight time constraints between the submission of reports and the deadline for submission of rebuttal reports, I only analyze Dr. Cooper's report in the House clusters and not the Senate clusters. My analysis has been provided to the best of my ability given the time constraints.

so it is not possible to compare his results with mine to identify if there are differences at this more granular level.

- In many of the 12 county groupings considered by Drs. Pegden and Mattingly in the House the Enacted Plan is either not a statistical outlier, is not substantively different from the simulations, or is in agreement with the map proposed by the NCLCV plaintiffs in the districts under dispute. Furthermore, in other cases there are reasonable explanations for the boundaries of the map that are separate from partisanship.

- In the 5 county groupings considered by plaintiffs' experts in the Senate, there is also often disagreement on whether the map constitutes a large outlier. In many of the clusters the Enacted Plan is either not a statistical outlier, is not substantively different from the simulations, or is in agreement with the map proposed by the NCLCV plaintiffs in the districts under dispute.

I am an associate professor of political science at Brigham Young University and faculty fellow at the Center for the Study of Elections and Democracy in Provo, Utah. I received my PhD in political science from Princeton University in 2014 with emphases in American politics and quantitative methods/statistical analyses. My dissertation was awarded the 2014 Carl Albert Award for best dissertation in the area of American Politics by the American Political Science Association.

I teach a number of undergraduate courses in American politics and quantitative research methods.[2] These include classes about political representation, Congressional elections, statistical methods, and research design.

I have worked as an expert witness in a number of cases in which I have been asked to analyze and evaluate various political and elections-related data and statistical methods. Cases in which I have testified at trial or by deposition are listed in my CV, which is attached to the end of this report. I have previously provided expert reports in a number of

[2]The political science department at Brigham Young University does not offer any graduate degrees.

cases related to voting, redistricting, and election-related issues: *Nancy Carola Jacobson, et al., Plaintiffs, vs. Laurel M. Lee, et al., Defendants. Case No. 4:18-cv-00262 MW-CAS (U.S. District Court for the Northern District of Florida); Common Cause, et al., Plaintiffs, vs. Lewis, et al., Defendants. Case No. 18-CVS-14001 (Wake County, North Carolina); Kelvin Jones, et al., Plaintiffs, v. Ron DeSantis, et al., Defendants, Consolidated Case No. 4:19-cv-300 (U.S. District Court for the Northern District of Florida); Community Success Initiative, et al., Plaintiffs, v. Timothy K. Moore, et al., Defendants, Case No. 19-cv-15941 (Wake County, North Carolina); Richard Rose et al., Plaintiffs, v. Brad Raffensperger, Defendant, Civil Action No. 1:20-cv-02921-SDG (U.S. District Court for the Northern District of Georgia); Georgia Coalition for the People's Agenda, Inc., et. al., Plaintiffs, v. Brad Raffensberger, Defendant. Civil Action No. 1:18-cv-04727-ELR (U.S. District Court for the Northern District of Georgia); Alabama, et al., Plaintiffs, v. United States Department of Commerce; Gina Raimondo, et al., Defendants. Case No. CASE NO. 3:21-cv-00211-RAH-ECM-KCN (U.S. District Court for the Middle District of Alabama Eastern Division); League of Women Voters of Ohio, et al., Relators, v. Ohio Redistricting Commission, et al., Respondents. Case No. 2021-1193 (Supreme Court of Ohio); Adams, et al., Relators, v. DeWine, et al., Respondents. Case No. 2021-1428 (Supreme Court of Ohio)*

In my position as a professor of political science, I have conducted research on a variety of election- and voting-related topics in American politics and public opinion. Much of my research uses advanced statistical methods for the analysis of quantitative data. I have worked on a number of research projects that use "big data" that include millions of observations, including a number of state voter files, campaign contribution lists, and data from the US Census. I have also used geographic information systems and other mapping techniques in my work with political data.

Much of this research has been published in peer-reviewed journals. I have published nearly 20 peer-reviewed articles, including in our discipline's flagship journal, *The American Political Science Review* as well as the inter-disciplinary journal,*Science Advances*. My CV,

which details my complete publication record, is attached to this report as Appendix A.

The analysis and opinions I provide in this report are consistent with my education, training in statistical analysis, and knowledge of the relevant academic literature. These skills are well-suited for this type of analysis in political science and quantitative analysis more generally. My conclusions stated herein are based upon my review of the information available to me at this time. I reserve the right to alter, amend, or supplement these conclusions based upon further study or based upon the availability of additional information. I am being compensated for my time in preparing this report at an hourly rate of $400/hour. My compensation is in no way contingent on the conclusions reached as a result of my analysis. The opinions in this report are my own, and do not represent the view of Brigham Young University.

2 Review of Dr. Magleby's Report

My review of Dr. Magleby's report shows many areas in which our data and methods are similar and a few important areas where we differ in our methods. I begin with areas of similarity. As my report considered only the state legislative districts and not the congressional districts, I focus on that portion of Dr. Magleby's report as well.

My review of his report over the last several days indicates that our analysis is similar in the following ways:

- We both use a redistricting simulation algorithm to construct hypothetical legislative districts in the NC House and Senate.
- We both use data from historical elections at the level of the VTD to compute the partisan lean of the Enacted Plan as well as the simulated districts.
- We both use statewide election data to compute partisan indices.
- Using the partisan indices, we both compute the number of districts "carried" by

Democrats and Republicans as a measure of the partisan lean of the districts in the Enacted Plan and the set of simulations.

Our analysis differs in the following ways:

- While we both use a redistricting simulation algorithm to construct hypothetical legislative districts in the NC House and Senate, the exact method and computer programs differ in their construction.

- While we both use data from historical elections at the level of the VTD to compute the partisan lean of the Enacted Plan as well as the simulated districts, we use slightly different elections to generate a partisan index for each district. Professor Magleby uses the following elections in 2016 and 2020 in his index: President, US Senate, Governor, Lieutenant Governor, Attorney General, Treasurer, Secretary of State, Auditor, Agriculture Commissioner, Insurance Commissioner, Labor Commissioner, and Superintendent of Public Instruction. I also use elections for President, US Senate, Governor, Lieutenant Governor, and Attorney General. Due to the very tight time constraints of this case I was unable to obtain data for Treasurer, Secretary of State, Auditor, Agriculture Commissioner, Insurance Commissioner, Labor Commissioner, and Superintendent of Public Instruction. I also include the 2014 Senate race. However, the differences in our indices will not make a large difference given the large number of elections included in either index. Any one election carries very little weight. Finally, if the intention of simulations is to compare the Enacted Plan to a set of simulated districts, the more important factor is that the measure by which the Enacted Plan is evaluated is the same as the measure by which the simulated districts are measured. This is true of both sets of simulations.

- Professor Magleby takes a random sample of 1,000 districting plans from a larger set of simulations to use as his comparison set. From the description in his report, it appears that there is no consideration for whether the simulated districts divide more

counties or are more or less compact than the Enacted Plan. In my report I only include simulations with as many or fewer county traversals and simulations in which the districts comprising the county grouping have an average compactness score that is as large or larger than the Enacted Plan.

- We both conduct simulations separately for each county grouping, however, Professor Magleby's report does not include them in his report. Because of this, I am unable to identify county groupings where the Enacted Map may differ from the simulated districts.

At the statewide level, our results are quite similar. In the State House Dr. Magelby's index predicts the Enacted Plan to have 48 Democratic districts (see Figure 1 of Magleby report). Dr. Magleby's simulations produce a distribution of seats carried by Democrats, with a peak at 52 seats carried by Democrats for a gap of 4 seats between the Enacted Plan and the modal outcome of the simulations.

My index in the House yields 49 seats carried by Democrats (see Tables 1 and 2 in Barber report). Because I consider each county grouping separately, I do not produce a single statewide histogram of seats carried by Democrats statewide, however, Tables 1 and 2 in my report show the middle 50% range of simulations across all House clusters to be 50-55 Democratic seats, which would include the modal outcome in Dr. Magleby's Figure 1. This produces a gap of 1-6 seats between the Enacted Plan and the middle 50% range of simulated plans.

In the State Senate Dr. Magelby's index predicts the Enacted Plan to have 19 Democratic districts (see Figure 3 of Magleby report). Dr. Magleby's simulations produce a distribution of seats carried by Democrats, with a peak at 22 seats carried by Democrats for a gap of 3 seats between the Enacted Plan and the modal outcome of the simulations.

My index yields 20 seats carried by Democrats in the State Senate (see Tables 31 and 32 in Barber report). Because I consider each county grouping separately, I do not produce a single statewide histogram of seats carried by Democrats statewide, however, Tables 31

and 32 in my report show the middle 50% range of simulations across all clusters to be 23 Democratic seats for a gap of 3 seats between the Enacted Plan and the modal outcome of the simulations.

3 Review of Dr. Cooper's Report

Dr. Cooper provides no quantitative analysis of the Enacted Plan aside from computing a few different partisan indices of the Enacted Plan. He does not compare the plan to any other alternative plan or set of plans, simulated or otherwise. While the partisan indices he uses are quantitative in nature, the analysis he conducts is fundamentally qualitative. For his analysis of the State House and Senate he looks at each county grouping and offers opinions and anecdotes about the boundaries of the districts as well as the supposed intentions of the legislature. However, he offers no evidence aside from his own opinion to support his assertions of the intentions of the legislature when drawing the district boundaries.

There is nothing wrong, per se, with a qualitative approach to evaluating a state's map. However, qualitative research requires the same standards and rigor as quantitative research. King, Keohane, and Verba (2021), arguably the most influential recent work on qualitative research, describe the need for rigorously defined standards in qualitative research as the following:

> We argue that nonstatistical research will produce more reliable results if researchers pay attention to the rules of scientific inference—rules that are sometimes more clearly stated in the style of quantitate research....Indeed the distinctive characteristic that sets social science apart from casual observation is that social science seeks to arrive at valid inferences by the systematic use of well-established procedures of inquiry (pg. 4).[3]

[3]King, Gary., Verba, Sidney., Keohane, Robert O.. Designing Social Inquiry: Scientific Inference in Qualitative Research, New Edition. United States: Princeton University Press, 2021.

From my review of Dr. Cooper's cluster-by-cluster analysis, there is no systematic process by which he determines if a set of districts in a county group constitute a gerrymander or not. Dr. Cooper does not describe any methods or processes that would be consistent with analysis in political science. Instead, I would describe his report as more akin to "casual observation," rather than rigorous social science. Nevertheless, I consider the particular county groups that he identifies and compare his assessment to that of my report and the other plaintiff expert reports.

4 Review of Dr. Pegden's Report

Dr. Pegden provides an analysis of the districts in the State House and Senate, as well as the congressional maps. However, I only consider the State House and Senate portion of his report. My understanding of his analysis is that he performs something akin to a simulation analysis, but in a slightly different way. Through a series of very large number of small perturbations to the existing districts that adhere to the redistricting criteria in North Carolina he creates a large set of comparison maps. He then compares the Enacted Map to this set of comparison maps using the 2020 Attorney General election as a "proxy for partisan voting patterns (pg. 9)" in two ways.

Unlike myself, Professor Magleby, and Professor Mattingly, Dr. Pegden only considers one election instead of an index or series of elections. It is unclear to me why he makes this choice since using any individual election as a proxy for future state legislative election results will be subject to the idiosyncrasies (candidate-related factors, issues specific to the office and campaign, campaign spending/advertising, etc) of the particular election chosen. While he provides alternative elections in the Appendix of his report for the 2020 Presidential election, the 2020 Lieutenant Governor election, and the 2020 Governor election, these are only included for the statewide analysis and do not look at specific county groupings in a group-by-group analysis, like is done earlier in his report.

The first analysis Dr. Pegden conducts is to determine the proportion of maps that are more "partisan" than the set of comparison maps. This fraction is treated throughout the report in a similar fashion to a reported p-value in other quantitative research in the social sciences. As Dr. Pegden states: "My method produces a rigorous p-value (statistical significance level) which precisely captures the confidence one can have in the findings of my "second level" analyses. In particular, for my statewide analyses, my second-level claims are all valid at a statistical significance of p = .002 (pg. 6)."

He also produces an additional analysis for each county grouping in which he computes the expected seat share for the Enacted Plan and compares this to the expected seat share of the set of comparison maps he produces. As he states: "When I am evaluating the partisanship of a comparison districting (to compare it to the Enacted Plan), I am interested in the number of seats we expect Democrats might win in the districting, given unknown shifts in partisan support. In particular, the metric I use is: How many seats, on average, would Democrats win in the given districting, if a random uniform swing is applied to the historical voting data being used?" This comparison is akin to a measure of substantive significance, as it helps us to understand the substantive difference between the Enacted Map and the set of comparison maps generated by Dr. Pegden's algorithm.

Substantive significance is a way of measuring the "practical significance" of a statistical finding. Gross (2015) states, "The function of statistical tests is merely to answer: Is the variation great enough for us to place some confidence in the result; or, contrarily, may the latter be merely a happenstance of the specific sample on which the test was made? The question is interesting, but it is surely secondary, auxiliary, to the main question: Does the result show a relationship which is of substantive interest because of its nature and its magnitude? "[4] As an example, suppose a drug trial discovers a drug to reduce blood pressure that produces a statistically significant effect in a randomized controlled trial. However,

[4]Gross, Justin H. "Testing What Matters (If You Must Test at All): A Context-Driven Approach to Substantive and Statistical Significance." American Journal of Political Science 59, no. 3 (2015): 775-788. quoting Kish, Leslie. 1959. "Some Statistical Problems in Research Design." American Sociological Review 24(3):328–38.

suppose that the substantive impact of this drug on patients' blood pressure remains very small. Given this, it may not be in the interests of the company to produce the drug given other considerations such as cost, potential side effects, and the opportunity costs of other activities. This would be an example of a difference between statistical and substantive significance.

The previous paragraph is relevant to Dr. Pegden's analysis because the first and second level analyses he provides are akin to measures of statistical significance while the expected seat share he computes is akin to a measure of substantive significance. Various measures of redistricting have been created and used, but agreement on any one particular measure as the ideal is lacking. Furthermore, even when a particular measure is agreed upon, what constitutes a substantively significant difference using that measure is even rarer.[5] Cain et al. summarise this issue well when they state, "Any partisan gerrymandering doctrine that the Court adopts will presumably allow states to draw maps that deviate some from the counterfactual plans. Strict adherence is not likely to be required. The critical question in applying this method then becomes: How much deviation is too much?"[6]

Given this, agreement on a strict definition of substantive significance is vanishingly rare. As a guidepost, I look at the expected seat share between the Enacted Plan and the expected seat share of the middle 50% of Dr. Pegden's simulations (in other words, the simulations which constitute the 25th to the 75th percentile). I then calculate how this difference would translate into an expectation for a party to pick up an additional seat over the 5 legislative elections that would take place over the decade in which the plan would be in place.[7] A redistricting plan is in place for a decade, so it makes sense to consider the

[7]I also use the middle 50% standard in my own analysis when looking at whether the Enacted Plan is

substantive differences over that time period.

5 Review of Dr. Mattingly's Report

Dr. Mattingly also produces a set of simulated districting plans and compares the Enacted Plan to this set of comparison maps. Dr. Mattingly does not produce an election index, but instead analyzes separately the results in 12 or 16 different elections in 2016 and 2020. In his statewide analysis he includes 2020: Attorney General, United States Senate, Commissioner of Insurance, Lieutenant Governor, Governor, State Treasurer, Secretary of State, State Auditor, Commissioner of Agriculture, Commissioner of Insurance, and US President; 2016: Commissioner of Agriculture, Governor, Lieutenant Governor, US Senate, and President. In his cluster-by-cluster analysis these elections are 2020: Attorney General, United States Senate, Commissioner of Insurance, Lieutenant Governor, Governor, State Treasurer, Secretary of State, State Auditor, Commissioner of Agriculture, and United States President; 2016: Lieutenant Governor and President. It is unclear to me why he does not include the other 2020 races in the cluster-by-cluster analysis.

In his analysis of the State House Dr. Mattingly produces two different "ensembles" or sets of simulations. The first set he describes as "matched" in that the simulations match the criteria used to draw the Enacted Plan. However, this is often not the case in the cluster-by-cluster analyses where the simulations often do not match the degree to which the Enacted Plan follows these criteria (See, for example, Figures 6.1.3, 6.1.9, 6.1.12, 6.1.21, 6.1.24, 6.1.27, 6.1.30, 6.1.33, 6.1.36 where the Enacted Plan splits fewer municipalities or has fewer ousted voters than a substantial number of the simulations). The simulations are often higher than the Enacted Plan in number of municipalities split, number of voters "ousted" from a district (see pg. 9 of the Mattingly report for a description of ousted voters), and the average compactness of the simulated districts is also often lower than the Enacted Plan (see

an outlier from the simulation results. This interquartile range is a commonly used measure of the central range of expected outcomes in a distribution.

Figure 7.3.1 in Mattingly Report.) Given this, I analyze the results of Dr. Mattingly's second set of simulations that are more strict regarding municipal splits and district compactness and do not consider the first set of simulations especially helpful in analyzing the Enacted Plan.

In his analysis of the State Senate the opposite is true. As in the House Dr. Mattingly produces two different "ensembles" or sets of simulations. The first set he describes are "matched" in that the simulations match the criteria used to draw the Enacted Plan. Here Dr. Mattingly notes, "We will see that the enacted NC Senate preserves municipalities to a high degree; in a way consistent with the most municipality preserving distributions we could produce. Hence, we also provide a Secondary Ensemble for the NC Senate which does not explicitly preserve municipalities (though compactness and the county preservation lead to a degree of municipality preservation.) It coincides with the primary ensemble properties in other resects" (pg. 6). Given the stated interests of the legislature in keeping municipalities whole, it is unclear to me why it would be useful to produce an analysis that intentionally violates this principle.[8] As such, I focus my comparisons on the first set of simulations in the Senate.

6 Disagreement Among Plaintiffs' Experts in House County Groupings

In this section I consider the county groupings that are singled out in the various expert reports submitted by the plaintiffs as being especially egregious examples of gerrymandering. However, as I will show, there is often disagreement even among the plaintiffs' own experts as to the presence, degree, and extent of the problem.

[8]For example, the committee hearing transcripts state: "We honored municipal boundaries. The chair made every effort to keep municipalities whole throughout the draw." See 9:43:00-9:45:00 in the committee hearing `https://www.youtube.com/watch?v=7pyfVT6VOc4&t=34565s&ab_channel=NCGARedistricting` and `https://www.youtube.com/watch?v=G0VerOsNMm4&ab_channel=NCGARedistricting` in the Senate.

6.1 Pitt House County Grouping

The Pitt county grouping contains two districts. The largest city in the cluster is Greenville, with a population of 87521, or nearly 1 district exactly (the target district population in the House is 208,788). However, creating a district that is entirely Greenville with the second district constituting everything in Pitt County that is not Greenville would create a district that resembles a donut hole (in other words, an embedded district). This type of district is also not proposed in the NCLCV proposed map. Given this, to avoid a "donut hole" scenario requires connecting the district that incorporates the majority of Greenville to the edge of the county so as to make sure this district is no longer embedded in the outer district. Simply adding a VTD to the district is not possible since no single VTD can be added without making the population of the district too large and the district highly non-compact. Thus, extending the boundaries of the district to the edge of the county necessitates splitting Greenville. The legislature chose to do this in a relatively east-west direction with northern Greenville in HD-8 and southern Greenville in HD-9.

Dr. Pegden's report states, "My theorems imply that the enacted districting is among the most optimized-for-partisanship 11% of all alternative districting satisfying my districting criteria (in other words, 89.1% are less optimized-for-partisanship)...(pg. 21)". 11% would not constitute a statistical outlier in a traditional scientific study.

With regards to substantive significance, Dr. Pegden's analysis predicts the expected seats from a range of uniform swings in election outcomes in the Enacted Plan in this cluster to be 1.3 Democratic seats. To gauge the substantive significance of this result, I compare it to the 25th percentile outcome of the simulations on the same metric. This yields an expected seats of between 1.45 Democratic districts, for a difference of between .15 districts. In other words, in a series of 5 elections with varying electoral environments (some good for Democrats and some good for Republicans) in each district in the cluster, we would expect the Enacted Map to elect an additional Democrat in the county group less than 1 time, on average, than the simulated maps would do.

In Dr. Mattingly's report, all 12 elections he considers generate a strongly Democratic district (HD-8). In only 3 of the 12 elections he considers a majority of the simulations create a second Democratic district while in 9 of the 12 elections the majority of the simulations generate a Republican district. In Figure 6.1.23 the Enacted Plan agrees with the majority outcome of the simulations in 10 of the 12 elections he considers.

These results are similar to those contained in my original report. In 10 of the 11 elections I include a majority of simulations generate one Democratic District and one Republican leaning district. In 10 of the 11 elections, the Enacted Plan agrees with the majority outcome of the simulated maps.

The overall picture here is one of agreement that in the majority of cases the Enacted Plan and the simulations generate one Democratic-leaning district and one Republican-leaning district.

Dr. Cooper does not provide any analysis of the Enacted Plan aside from calculating a partisan index of the districts. However, Dr. Cooper notes that Pitt County is currently represented by two Democrats, Kandie Smith and Brian Farkas. Dr. Cooper fails to note the old (2020) districting arrangement had 3 districts in Pitt County with the third district (District 12) extending into Lenoir County and being represented by Republican Chris Humphrey.

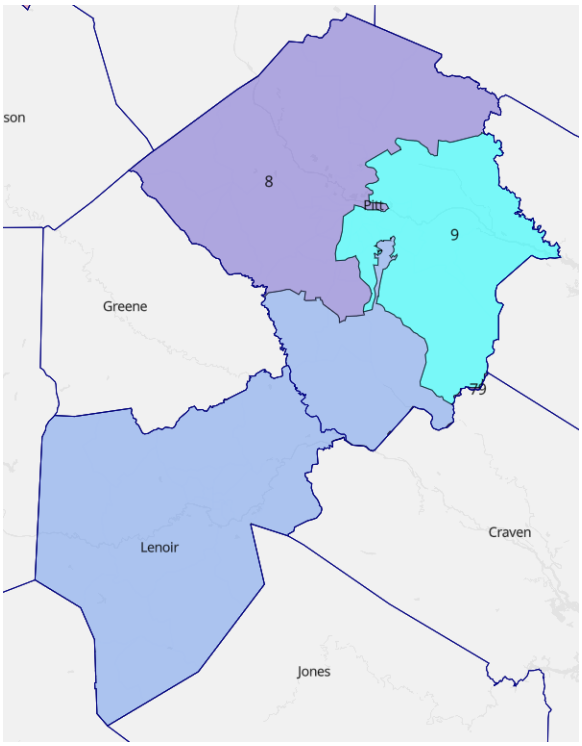

Figure 1: **2020 Districts in Pitt County**

6.2 Alamance House County Grouping

The Alamance County grouping contains two districts, HD-63 and HD-64. In this county there is disagreement between plaintiffs' experts as to whether or not the Enacted Map constitutes a gerrymander. Drs. Pegden and Mattingly do not find the map to be a partisan outlier, while Dr. Cooper objects to the particular shape of the districts.

Dr. Pegden's analysis places the Alamance County plan among the lowest quarter of districtings. He states, "In every run, the districting was in the most partisan 74% of districtings (in other words, 26.3% were less partisan, in every run) (pg. 23)." Because of this, he further states, "The Enacted Map is not unusual enough in the first-level analysis to enable a statistically significant second-level analysis of this cluster (pg. 23)." Looking at the range of expected Democratic seats in this county, the Enacted Plan is actually *more* Democratic than the median simulation in Dr. Pegden's report.

Dr. Mattingly also agrees that this plan is not an outlier. He states, "From Figure 6.1.25, we see that thought [sic] the Enacted Map tends have more Democrats in the more Democratic district and less in the less democratic [sic] district it not [sic] an outlier on its own (pg. 46)."

The simulations in my initial report also agree with this assessment. In 10 of 11 elections I analyze, the partisan lean of the districts in the Enacted Plan agree with the partisan lean of the majority of the simulations run. In 6 of the 11 elections a Democrat won a majority of the two-party vote in District 63 while in 5 of the elections the Republican candidate won the majority of the votes.

However, Dr. Cooper notes the unusual shape of the district but does not mention that this shape is largely the same (different by only 2.5 precincts) as the 2019 court-approved maps.

6.3 Duplin-Wayne House County Grouping

The Duplin-Wayne County grouping contains two districts, HD-4 and HD-10.

Dr. Pegden does not provide an analysis of this county. He states, "For this cluster, my conservative approach (as discussed in Section 4.3.2) does not allow my algorithm to generate any comparison maps other than the map itself." This is interesting as it aligns with my simulations in which I found no alternative maps that had an equal (or fewer) number of county traversals and were as compact or more compact than the Enacted Plan (see pg. 58 of Barber original report).

Dr. Mattingly does not find the map to be a partisan outlier in his analysis. He states, "In the Duplin-Wayne county cluster the two districts are safely Republican under the elections considered. The Enacted Map is typical, falling in the middle of the observed democratic [sic] fraction on the Histograms (pg. 42)."

However, the proposed NCLCV Map generates one consistently Democratic-leaning district across all 11 election that I analyze. This constitutes a partisan outlier in all 11 elections I consider and would also fall outside the majority of the simulation results in all comparable elections in Dr. Mattingly's simulations as well.[9]

[9]While we do not use the same elections Dr. Mattingly and I both use the 2016 Lieutenant Governor, 2016 President, 2020 Lieutenant Governor, 2020 US Senate, 2020 President, 2020 Attorney General, and 2020 Governor races.

6.4 Buncombe House County Grouping

The Buncombe County grouping contains three districts, HD-114, HD-115, and HD-116. In this county there is agreement among experts that the Enacted Map in this county grouping generally creates two Democratic seats and 1 Republican-leaning seat. The degree to which this is a partisan outlier is less certain.

Dr. Pegden reports that the Enacted Map in this county "was in the most partisan 0.020% of districtings (in other words, 99.979% were less partisan, in every run) (pg. 16)." This is a statistically significant result. The Enacted Map has an expected Democratic seats generated from the uniform swing analysis of 2.26 seats while the 25th percentile plan has an expected Democratic seats of 2.85. This leads to a substantive difference of 0.59 expected Democratic seats. Put another way, across 5 hypothetical elections of each district in the cluster, we would expect the Enacted Map to elect one fewer Democrat (meaning 2 rather than 3 in this cluster) than the 25th percentile simulation roughly 3 additional times.

Dr. Mattingly's presents simulations in which the Enacted Map and the simulations agree on the creation of 2 Democratic districts in the cluster (HD-114 and HD-115). In all 12 elections considered the Enacted Map and the simulations are in agreement on the partisan lean of these two ditricts. The third district, HD-116, is the source of the disagreement. In 10 of the 12 simulations HD-116 in the Enacted Plan does not agree with the majority of the simulations in Dr. Mattingly's report (see Figure 6.1.14).

Dr. Cooper offers his assessment by saying "By shifting the current district lines where the districts meet in Asheville, however, the Enacted Map packs as many Democrats as possible into HD-114, while HD-115 stays relatively constant in terms of predicted vote share. The C-shaped HD-116 now includes most of the Republican-leaning VTDs in Buncombe..." Dr. Cooper appears to imply that a more appropriate orientation of the district lines would be to place a substantial portion of Asheville into each of the three districts.

In other words, across all three experts, the disagreement with the Enacted Plan centers on district HD-116. The "C" shape in District HD-116, as noted by Dr. Cooper, is

the result of a decision to minimize the division of the city of Asheville. With a population of 94,589, the city will need to be split into two different districts, but not necessarily three. The Enacted Plan does this by placing approximately 87 percent of the city population in two districts, HD-114 and HD-115, leaving HD-116 to wrap around the the city and largely avoid its boundaries. This, however, creates the "C" shape of the district.

Finally, Dr. Cooper states, "Soon after the maps were passed, all three Democratic incumbents announced that they would be retiring and not running for office in these newly drawn districts." It is unclear to me how this fact is relevant to the shape of the new districts. If the Enacted Map create two strong Democratic districts, how is the announced retirement of all three Democratic incumbents in any way a result of the districting process, as Dr. Cooper implies? Dr. Cooper does not offer any other evidence that something else related to the new districts may have been the cause, such as double bunking, or a dramatic shift in the composition of each district from the old (2020) districts.

6.5 Cumberland House County Grouping

The Cumberland County group contains four districts, HD-42, HD-43, HD-44, and HD-45. In this cluster there is disagreement between the experts as to whether this county constitutes an extreme gerrymander.

Dr. Pegden's analysis contend the that the Enacted Plan is neither a statistically significant nor substantively significant outlier. He states, "In every run, the districting was in the most partisan 16% of districtings (in other words, 83.5% were less partisan, in every run)...The Enacted Map is not unusual enough in the first-level analysis to enable a statistically significant second-level analysis of this cluster (pg. 27)."

Beyond not being statistically unique, the substantive difference in the number of expected Democratic seats is very small. The Enacted Map has an expected Democratic seats generated from the uniform swing analysis of 3.21 seats while the 25th percentile plan has an expected Democratic seats of 3.25. This leads to a substantive difference of between 0.04 expected Democratic seats. In other words, across 5 hypothetical elections of each district in the cluster, we would expect the Enacted Map to elect one fewer Democrat (meaning 3 rather than 4 in this cluster) than the 25th percentile simulation less than 1 additional time.

Dr. Mattingly's presents analysis in which the simulations generate two solidly Democratic districts (HD-44 and HD-42) and two districts that are closer to the .50 line with HD-43 being Democratic-leaning and HD-45 being Republican-leaning (see Figure 6.1.29 in Mattingly Report). Regarding this outcome he states, "In an ensemble that better preserves municipalities, the most Republican district is typically more republican [sic] and the second most Republican district more Democratic. This makes the Enacted Plan which squeezes the two together with an [sic] large outlier."

A closer look at Figure 6.1.29 shows that the Enacted Plan is an outlier not because it favors one party over the other, but rather because it creates more competitive races than the majority of Dr. Mattingly's simulations. While Dr. Mattingly's simulations produce

a reliably Republican district in HD-45 and a reliably Democratic district in HD-43, the Enacted Plan creates neither and instead generates two very competitive districts. This produces a responsive map in which the partisanship of legislators elected to these two districts will likely shift frequently with shifting electoral preferences, something Dr. Mattingly notes is a desirable feature of a districting plan in other portions of his report (see pg. 3 and 4 of Mattingly Report).

Dr. Cooper agrees with this this when he states, "The Enacted Map creates two extremely competitive districts, HD-43 and HD-45 (with CCSC scores of D+1,334 and D+663, respectively) by splitting the Democratic-leaning City of Fayetteville into all four districts in the cluster." While his assessment of the competitiveness of these two districts is correct, he is incorrect as to the reason. Fayetteville has a population of 208,501 and as such is required to be divided into at least three districts, but not four. And while the Enacted Plan does draw parts of Fayetteville into all four districts, only 7.3 % of Fayetteville's population is placed in District 45.

Furthermore, the Enacted Plan places a much smaller proportion of Fayetteville in to the 45th district than NCLCV plaintiff's proposed map does. If Dr. Cooper's objections to dividing municipalities more than necessary is applied to this map, then plaintiff's map fares much worse than the Enacted Map. The table and figure below shows the comparison of how Fayetteville is divided in the two plans, which is also shown as Table 18 and Figure 54 in my original report.

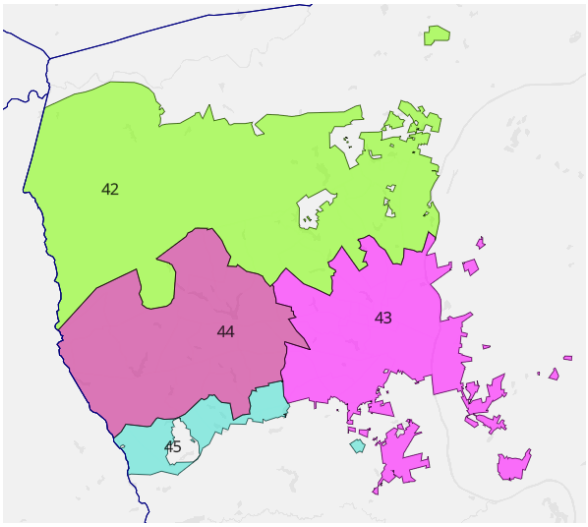

Table 1: Division of Fayetteville in Enacted Plan and NCLCV Plan

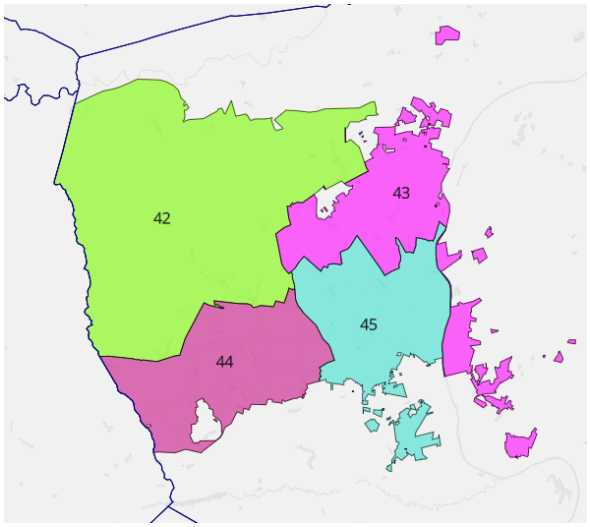
	Percent of Feyetville in district	
District:	Enacted Plan	NCLCV Plan
42	31.4	33.4
43	21.4	21.5
44	39.9	26.8
45	7.3	18.3
Total:	100%	100%



Note: Population number for city by district for Enacted Plan from: `https://ncleg.gov/Files/GIS/Plans_Main/Senate_2021/SL%202021-173%20Senate%20-%20StatPack%20Report.pdf` Population numbers for city by district for NCLCV Plan from Dave's Redistricting online. `https://davesredistricting.org/`

Figure 2: **Map of Fayetteville Divisions in Cumberland County Cluster**

(a) Enacted Map

(b) NCLCV Map

6.6 Durham-Person House County Grouping

The Durham-Person County grouping contains 4 districts, HD-2, HD-29, HD-30 and HD-31. In this cluster there is disagreement with one district in particular, HD-2, which takes in the entirety of Person County to the north and the northern and eastern portions of Durham county.

Dr. Pegden's analysis of this county cluster yields the following results. He states, "My theorems imply that the enacted districting is among the most optimized-for-partisanship 0.20% of all alternative districtings satisfying my districting criteria (in other words, 99.79% are less optimized-for-partisanship)" (pg. 25).

However, the substantive effect of this difference is very small. The Enacted Map has an expected Democratic seats generated from the uniform swing analysis of 3.87 seats while the 25th percentile plan has an expected Democratic seats of 3.95. This leads to a substantive difference of between 0.08 expected Democratic seats. Put another way, across 5 hypothetical elections of each district in the cluster, we would expect the Enacted Map to elect one fewer Democrat (meaning 3 rather than 4 in this cluster) than the 25th percentile simulation less than 1 additional time.

Dr. Mattingly's simulations reveal three highly Democratic districts and one district that is more competitive. In the three highly Democfatic district (HD-31, HD-29, and HD-30), the Enacted Plan and the simulations are in agreement in all 12 of the 12 elections considered. In 10 of the 12 elections he considers the Enacted Plan agrees with the majority of simulations on the partisanship of the more competitive district, HD-2 (see Figure 6.1.23 of Mattingly Report).

Dr. Cooper simultaneously criticizes the map for dividing Durham across all four district while also packing Democratic into three of the four districts. He states, "The Enacted Map splits the City of Durham across all four districts but packs Democratic voters in HDs 29, 39, and 31; there is not a single Republican or competitive VTD in those districts (pg. 84)." This is a confusing complaint to offer since there are nearly no Republican VTDs

in Durham County (if any at all when looking at Map 40 in Dr. Cooper's report), so it comes as no surprise that the three districts that are entirely contained in Durham County would contain no Republican-leaning VTDs. Furthermore, Dr. Cooper notes that the city of Durham is included in all four districts. However, remedying this by making sure District 2 contained no portion of Durham would only further make District 2 more Republican as the most Democratic VTDs in District 2 are those within the Durham city limits. Furthermore, the population of Durham is 283,506, which means it is large enough that it is absolutely necessary to include parts of Durham in all four districts.

6.7 Brunswick-New Hanover House County Grouping

The Brunswick-New Hanover County grouping contains 4 districts, HD-17, HD-18, HD-19, and HD-20. In this case, there is disagreement between experts as to whether this cluster constitutes an extreme gerrymander.

Dr. Pegden's analysis contends that the Enacted Plan is not a significant outlier, statistically or substantively. He states, "In every run, the districting was in the most partisan 11% of districtings (in other words, 89.4% were less partisan, in every run). The Enacted Map is not unusual enough in the first-level analysis to enable a statistically significant second-level analysis of this cluster (pg. 24)."

Beyond not being unusual in comparison to the simulations to perform a statistically significant second-level analysis, the substantive difference in the expected Democratic seat share is also very small. The Enacted Map has an expected Democratic seats generated from the uniform swing analysis of 1.25 seats while the 25th percentile plan has an expected Democratic seats of 1.25. This leads to a substantive difference of between 0.00 expected Democratic seats. In other words, across 5 hypothetical elections of each district in the cluster, we would not expect the Enacted Map to differ from the 25th percentile simulation at all, on average.

Dr. Mattingly argues on the other hand that the cluster is problematic. Specifically, he locates the problem in District 20. He states of this district, "The Republican party typically wins the second most democratic [sic] district [HD-20] in the Enacted Plan even though it would go to the Democrats under a number of elections when the neutral maps in the primary ensemble are used." Looking at Figure 6.1.35 in Dr. Mattingly's report we see that in 5 of the 12 elections the Enacted Plan agrees with the majority of simulations on the partisan lean of HD-20.

Dr. Cooper does not offer much by way of exposition in this cluster other than to claim that District 18 is packing Democratic voters "in and around Wilmington" and that "[t]he heavily Republican HD-19 also ensnares a Democratic-leaning VTD south of Wilmington,

which keeps that VTD out of competitive HD-20 (pg. 95)." Another way to consider the "packing" referred to by Dr. Cooper is to note that District 18 keeps the communities of Hightsville, Wrightsboro, Skippers Corner, Castle Hayne, Blue Clay Farms, Northchase, Murraysville, and Kings Grant — all municipalities in and around Wilmington — together. Secondly, the "ensnared" VTD that Dr. Cooper refers to is only moderately Democratic (.56 in the 2020 Presidential election) and would make only the slightest difference in the overall partisan lean of HD-20 were it to somehow capture it from HD-19.

6.8 Forsyth-Stokes House County Grouping

The Forsyth-Stokes County grouping contains 5 districts, HD-91, HD-71, HD-72, HD-74, and HD-75. In this county there is agreement among experts that the Enacted Map in this county grouping generally creates two Democratic seats and 2 Republican-leaning seats. The partisan lean of the middle district in the Enacted Plan, HD-74, is in dispute.

Dr. Pegden's analysis contends that the Enacted Plan is a significant outlier, statistically and substantively. He states, "My theorems imply that the enacted districting is among the most optimized-for-partisanship 0.26% of all alternative districtings satisfying my districting criteria (in other words, 99.73% are less optimized-for-partisanship) (pg. 18)."

The substantive difference in the expected Democratic seat share is as follows: The Enacted Map has an expected Democratic seats generated from the uniform swing analysis of 2.18 seats while the 25th percentile plan has an expected Democratic seats of 2.85. This leads to a substantive difference of 0.67 expected Democratic seats. Stated differently, across 5 hypothetical elections of each district in the cluster, we would expect the Enacted Map to elect one fewer Democrat (meaning 2 rather than 3 in this cluster) than the 25th percentile simulation roughly 3 additional times.

Dr. Mattingly's presents simulations that contain two districts that are consistently Democratic leaning (HD-71 and HD-72) and two districts in which the distribution of simulation results are nearly always Republican leaning (HD-91 and HD-75). Thus, the outlier in his analysis lies with HD-74 where the simulations often generate both Republican and Democratic leaning districts and the Enacted Plan is more consistently Republican leaning.

However, the Enacted Plan's District 74 is very similar in shape and partisan lean to the NCLCV "optimized map." A map of the similarities in these districts is presented in Figure 69 of my original report. The partisan lean of District 74 using the election index in my original report is 0.45 while the partisan lean of District 74 in the NCLCV map is 0.46. Thus, if the Enacted Map is an extreme gerrymander due to the boundaries and partisan lean of District 74, then this criticism would also apply to the proposed NCLCV map as

well.

Finally, Dr. Cooper notes of this district, "The splits of Winston-Salem do not make sense without reference to the anticipated voting behavior of the VTDs arranged into each district." However, this is not the case. The splits of Winston-Salem are largely the same as the 2020 maps, which were approved by a court in 2019. To a large degree the legislature appears to have chosen to leave the district boundaries much the same as the previous court-approved maps. Figure 69 in my original report presents this comparison between the current maps and the old maps in this cluster.

6.9 Cabarrus-Davie-Rowan-Yadkin House County Grouping

The Cabarrus County grouping contains 5 districts, HD-73, HD-76, HD-77, HD-82, and HD-83.

The layout of districts in this cluster is largely determined by the geography of the four counties in the cluster. Yadkin and Davie are sparsely populated and as such must constitute a portion of a single district (HD-77). This district then extends south into northern Rowan County, where it borders Davie County. Rowan County has a larger population - enough to sustain 1.68 districts. To minimize county traversals in the group, this implies creating a single district that is entirely contained within Rowan county and then another district that spans Rowan County and extends into northern Cabarrus County. Finally, Cabarrus County is the most populated county of the group (population = 225,804) with a population large enough to support 2.6 districts. This means that there will be two districts entirely contained in Cabarrus County with a partial district that spans Rowan and Cabarrus Counties. Because the county grouping is arranged in a linear North/South axis, this layout of districts - 1 in Yadkin and Davie, and partially in Rowan, 1 in Rowan, 1 spanning Rowan/Cabarrus, and 2 entirely in Cabarrus is the only arrangement that complies with the rules requiring the minimization of county traversals.

Thus, complaints of the districts are limited to the particular boundaries of the two and a half districts in Cabarrus county (HD-73, HD-82 and HD-83).

Dr. Pegden does not find the Enacted Plan to be a significant outlier. He states, "In every run, the districting was in the most partisan 12% of districtings (in other words, 87.7% were less partisan, in every run). The Enacted Map is not unusual enough in the first-level analysis to enable a statistically significant second-level analysis of this cluster (pg. 26)."

Beyond not being unusual in comparison to the simulations to perform a statistically significant second-level analysis, the substantive difference in the expected Democratic seat share is also very small. The Enacted Map has an expected Democratic seats generated from the uniform swing analysis of 0.33 seats while the 25th percentile plan has an expected

Democratic seats of 0.45. This leads to a substantive difference of 0.12 expected Democratic seats. In other words, across 5 hypothetical elections of each district in the cluster, we would expect the Enacted Map to elect one fewer Democrat (meaning 0 rather than 1 in this cluster) than the 25th percentile simulation less than 1 additional time.

Dr. Mattingly's simulations produce 4 very Republican districts and one district that generates both Republican and Democratic outcomes (HD-82), depending on the election one uses to measure partisanship. He states, "In the Cabarrus-Davie-Rowan-Yadkin county cluster, there are abnormally few Democrats in the most Democratic district (district 82)." In 4 of the 12 elections he considers the Enacted Plan agrees with the majority of the simulations on the partisanship of this swing district.

One important thing to note is that the proposed NCLCV map performs worse than the Enacted Plan by this metric described by Dr. Mattingly. The most Democratic district in this plan is actually *less* Democratic than the Enacted Plan (0.43 in the NCLCV plan compared to 0.41 in the Enacted Plan using the partisan index in my original report). Thus, by Dr. Mattingly's argument, this would place the NCLCV map as more of a partisan outlier than the Enacted Plan in this county cluster.

6.10 Guilford County House County Grouping

The Guilford County grouping contains 6 districts, HD-57, HD-58, HD-59, HD-60, HD-61, and HD-62.

Dr. Pegden's analysis contends that the Enacted Plan is a significant outlier. He states, "My theorems imply that the enacted districting is among the most optimized-for-partisanship 0.000089% of all alternative districtings satisfying my districting criteria (pg. 19)."

The substantive difference in the expected Democratic seat share is as follows: The Enacted Map has an expected Democratic seats generated from the uniform swing analysis of 4.46 seats while the 25th percentile plan has an expected Democratic seats of 5.45. This leads to a substantive difference of 0.99 expected Democratic seats. In other words, across 5 hypothetical elections of each district in the cluster, we would expect the Enacted Map to elect one fewer Democrat (meaning 4-5 rather than 5-6 in this cluster) than the 25th percentile simulation every time, on average.

Dr. Mattingly states of his simulations in this county: "The ensemble reliably has four democratic districts and a 5th which typically leans Republican but sometimes is competitive. Yet, the Enacted Plan gives one clearly Republican district and one which is often safely Republican and at times competitive (pg. 36)." District 59 is the district in question. Excluding HD-59, in 12 of the 12 elections the Enacted Plan agrees with the majority of Dr. Mattingly's simulations on the partisanship of the remaining 5 districts in the cluster. Thus the discussion of a potential gerrymander is focused on the composition of HD-59.

This also conforms with the simulation results in my original report. In 11 of the 11 elections I consider, the partisan lean of the districts in the Enacted Plan is one Democratic district short of the outcome in the majority of the simulations run.

However, one factor to consider is that District 59's boundaries are identical to the court-approved 2019 map's boundaries, but for one precinct, G53 (See Figure 78 in my original report for a map of the district under the two plans). District 59's population would

be is too large if the map were to use the exact boundaries from 2019 based on the updated 2020 census population numbers. At the same time, District 61 and 58 are within the new population thresholds based on the new census numbers. Thus, it makes perfect sense to move one precinct from 57 into either 61 or 58 to equalize the population of these districts. Precinct G53 may have been chosen because it contains the right population size and is nearly entirely within the city of Greensboro, allowing a larger share of Greensboro to be contained within fewer districts.

6.11 Mecklenburg County House County Grouping

The Mecklenburg County cluster contains 13 districts, HD-88, HD-92, HD-98, HD-99, HD-100, HD-101, HD-102, HD-103, HD-104, HD-105, HD-106, HD-107, and HD-112.

Dr. Pegden's analysis contends that the Enacted Plan is a outlier, but not to the degree of other clusters discussed above. He states, "My theorems imply that the enacted districting is among the most optimized-for-partisanship 5.0% of all alternative districtings satisfying my districting criteria (in other words, 95.0% are less optimized-for-partisanship) (pg. 20)." In a traditional scientific study, the 5% boundary represents the line of a statistically significant outlier.

The substantive difference in the expected Democratic seat share is as follows: The Enacted Map has an expected Democratic seats generated from the uniform swing analysis of 11.56 seats while the 25th percentile plan has an expected Democratic seats of 11.95. This leads to a substantive difference of 0.39 expected Democratic seats. Put another way, across 5 hypothetical elections of each district in the cluster, we would expect the Enacted Map to elect one fewer Democrat (meaning 11-12 rather than 12-13 in this cluster) than the 25th percentile simulation in approximately 2 of these 5 elections, on average. In other words, the difference across this range of electoral environments is Republicans picking up an additional seat about 2 in 5 times.

Dr. Mattingly's presents simulation analysis that present the partisan distributions of the different districts and where, specifically, an outlier might occur. Figure 6.1.2 of Dr. Mattingly's report shows that in the 10 most Democratic districts in the cluster, the Enacted Plan agrees with the majority of simulations in 12 of the 12 elections considered. Both the simulations and the Enacted Plan contain 9 comfortably Democratic districts and a 10th district that is Democratic in 11 of the 12 elections considered. In the 2 most Republican districts (HD-98 and HD-103), the Enacted Plan agrees with the majority of simulations in 12 of the 12 elections considered. These two districts occasionally lean Democratic and occasionally lean Republican, but in all 12 elections the Enacted Plan's partisan lean aligns

with the partisan lean of the majority of the simulations. This leaves one districts in dispute - HD-104. In District 104, the Enacted Plan agrees with the majority of the simulations in 11 of the 12 elections considered. Thus, across the 13 different districts in 12 different elections, the Enacted Plan is in alignment with the majority of the simulation results in all but 1 election (Figure 6.1.2 shows a misalignment of HD-104 with the majority of the simulations in the 2020 Commissioner of Agriculture election).

Dr. Cooper states that, "[t]he Enacted Map places no Republican VTDs in HDs 92, 99, 100, 101, 102, 106, 107, and 112, leaving every Republican-leaning VTD in HDs 88, 103, 104, and 105." Dr. Cooper omits here that there are very few Republican leaning VTDs at all on his map to begin with, they tend to be close to one another, and are concentrated in northern and southeastern Mecklenburg County. Thus it is not surprising that they are placed in relatively few of the districts given the desire for geographically compact districts. He notes the partisan composition of HDs 98 and 103 as being "carved out of the pockets of Republican voters in the north and southeast portions of the county... (pg. 68)." However, this assessment ignores the partisan geography of the cluster. District 98 is geographically compact and avoids traversing into the Charlotte city limits. Furthermore, District 103 in the southeast of the county keeps the cities of Mint Hill (there are 6 voters from this city not in District 103) and Matthews whole and together in one district.

6.12 Wake County House County Grouping

The Wake County cluster contains 13 districts, HD-11, HD-21, HD-33, HD-34, HD-35, HD-36, HD-37, HD-38, HD-39, HD-40, HD-41, HD-49, and HD-66.

Dr. Pegden's analysis contends that the Enacted Plan is a statistical outlier. He states, "My theorems imply that the enacted districting is among the most optimized-for-partisanship 2.2% of all alternative districtings satisfying my districting criteria (in other words, 97.8% are less optimized-for-partisanship) (pg. 22)."

The substantive difference in the expected Democratic seat share is as follows: The Enacted Map has an expected Democratic seats generated from the uniform swing analysis of 11.62 seats while the 25th percentile plan has an expected Democratic seats of 11.85. This leads to a substantive difference of 0.23 expected Democratic seats. In other words, across 5 hypothetical elections of each district in the cluster, we would expect the Enacted Map to elect one fewer Democrat (meaning 11-12 rather than 12-13 in this cluster) than the 25th percentile simulation in approximately 1 of these 5 elections, on average.

Dr. Mattingly's simulation analysis presents the partisan distributions of the different districts and where specifically an outlier might occur. Figure 6.1.5 of Dr. Mattingly's report shows that in the 10 most Democratic districts in the cluster, the Enacted Plan agrees with the majority of simulations in 12 of the 12 elections considered. In the most Republican district (HD-37), the Enacted Plan agrees with the majority of simulations in 9 of the 12 elections considered. This leaves two districts - HD-35 and HD-21. In District 35, the Enacted Plan agrees with the majority of the simulations in 7 of the 12 elections considered, and in HD-21 the Enacted Plan agrees with the majority of the simulations in 10 of the 12 elections considered. However, in the 2 elections where it is in disagreement, the Enacted Plan actually creates a *Democratic* leaning district where the majority of simulations create a Republican leaning district. Thus, the results in this cluster are mixed. Some of the Enacted Plan's districts are more Republican, on average, than the simulations and in other cases the Enacted Plan's districts are more Democratic. And in most cases there is agreement.

7 Disagreement Among Plaintiff Experts in Senate County Groupings

7.1 Cumberland and Moore Senate County Grouping

The Cumberland and Moore Senate county grouping contains two districts, SD-19 and SD-21.

Dr. Pegden's analysis contend that the Enacted Plan is a statistical outlier. He states, "My theorems imply that the enacted districting is among the most optimized-for-partisanship 0.000015% of all alternative districtings satisfying my districting criteria (in other words, 99.999984% are less optimized-for-partisanship) (pg. 28)."

The substantive difference in the expected Democratic seat share is as follows: The Enacted Map has an expected Democratic seats generated from the uniform swing analysis of 1.01 seats while the 25th percentile plan has an expected Democratic seats of 1.35. This leads to a substantive difference of 0.34 expected Democratic seats. Put differently, across 5 hypothetical elections of each district in the cluster, we would expect the Enacted Map to elect one fewer Democrat (meaning 1 rather than 2 in this cluster) than the 25th percentile simulation in approximately 1-2 of these 10 elections, on average. In other words, the difference across this range of electoral environments is Republicans picking up an additional seat less than 2 in 5 times.

Dr. Mattingly states of the result of the simulations in this cluster, "The districts in the enacted are chosen to maximize the number of Democrats in the more democratic district and the number of republicans in the most Republican district. The map is an extreme outlier in both of these regards. The effect is a maximally non-responsive map." It is noteworthy that in other clusters Dr. Mattingly criticizes the map for being overly responsive (see Cumberland House grouping discussion). Despite this critique, from Figure 6.2.10 we see that in all 12 elections the Enacted Map agrees with the majority of the simulations in all districts. In not a single election do a majority of the simulations produce

two Democratic seats.

It is also noteworthy that the NCLCV plaintiff's proposed plan is identical to Enacted Plan in this cluster.

7.2 Fosyth-Stokes Senate County Grouping

The Forsyth and Stokes Senate county grouping contains two districts, SD-31 and SD-32.

Dr. Pegden's analysis contend that the Enacted Plan is a statistical outlier. He states, "My theorems imply that the enacted districting is among the most optimized-for-partisanship 0.0051% of all alternative districtings satisfying my districting criteria (in other words, 99.9947% are less optimized-for-partisanship) (pg. 29)."

However, in this cluster the substantive difference in the expected Democratic seat share is nearly zero. This is a particularly good example of the importance of distinguishing between statistical and substantive significance. The Enacted Map has an expected Democratic seats generated from the uniform swing analysis of 1.00 seats while the 25th percentile plan has an expected Democratic seats of 1.05. This leads to a substantive difference of 0.05 expected Democratic seats. Put another way, across 5 hypothetical elections of each district in the cluster, we would expect the Enacted Map to elect one fewer Democrat (meaning 1 rather than 2 in this cluster) than the 25th percentile simulation in approximately 0 of these 5 elections, on average. In other words, the difference between the Enacted Plan and the simulations results across this range of electoral environments is effectively zero in this cluster.

Dr. Mattingly states of the result of the simulations in this cluster, "The districts in the enacted are chosen to maximize the number of Democrats in the more democratic district and the number of republicans [sic] in the most Republican district. The map is an extreme outlier in both of these regards. The effect is a maximally non-responsive map (pg. 61)." This is similar to his objection to the Cumberland-Moore cluster above, and is again

noteworthy that in other clusters Dr. Mattingly criticizes the map for being overly responsive (see Cumberland House grouping discussion). Despite this critique, from Figure 6.2.7 we see that in all 12 elections the Enacted Map agrees with the majority of the simulations in all districts. In not a single election do the simulations produce two Democratic seats.

7.3 Guilford-Rockingham Senate County Grouping

The Guilford and Rockingham Senate county grouping contains 3 districts, SD-26, SD-27, and SD-28.

Dr. Pegden's analysis contend that the Enacted Plan is a statistical outlier. He states, "My theorems imply that the enacted districting is among the most optimized-for-partisanship 0.00012% of all alternative districtings satisfying my districting criteria (in other words, 99.99987% are less optimized-for-partisanship) (pg. 31)."

The substantive difference in the expected Democratic seat share is as follows: The Enacted Map has an expected Democratic seats generated from the uniform swing analysis of 2 seats while the 25th percentile plan has an expected Democratic seats of 2.25. This leads to a substantive difference of 0.25 expected Democratic seats. Put differently, across 5 hypothetical elections of each district in the cluster, we would expect the Enacted Map to elect one fewer Democrat (meaning 2 rather than 3 in this cluster) than the 25th percentile simulation in approximately 1-2 of these 10 elections, on average. In other words, the difference across this range of electoral environments is Republicans picking up an additional seat less than 2 in 5 times.

Dr. Mattingly's summary of the simulations results in this cluster are as follows: "The three districts in the Guilford-Rockingham cluster are constructed to pack an exceptional number of democrats [sic] in the most democratic [sic] district (district 28) and exceptionally few Democrats in the most Republican district (district 26). The effect is to ensure a Republican victory in the district 26, when in some elections the most republican [sic] district would be at risk of going to the Democratic Party (pg. 63)." However, in 11 of the 12

elections the Enacted Map's least Democratic district (SD-26) agrees with the majority of the simulations by electing a Republican. In only 1 of the 12 elections do the majority of his simulations produce 3 Democratic districts while the Enacted Plan produces only 2. SD-26 is less competitive (i.e. more Republican leaning) than the majority of simulations, but the inverse is also true of SD-27, which is competitive in many of the simulations and in a few rare cases elects a Republican but is more Democratic and always elects a Democrat in the Enacted Plan.

7.4 Granville-Wake Senate County Grouping

The Granville and Wake Senate county cluster contains 6 districts, SD-13, SD-14, SD-15, SD-16, SD-17, and SD-18.

Dr. Pegden's analysis contend that the Enacted Plan is a statistical outlier. He states, "My theorems imply that the enacted districting is among the most optimized-for-partisanship 0.000030% of all alternative districtings satisfying my districting criteria (in other words, 99.999969% are less optimized-for-partisanship) (pg. 30)."

The substantive difference in the expected Democratic seat share is as follows: The Enacted Map has an expected Democratic seats generated from the uniform swing analysis of 5.13 seats while the 25th percentile plan has an expected Democratic seats of 5.75. This leads to a substantive difference of 0.62 expected Democratic seats. Put another way, across 6 hypothetical elections of each district in the cluster, we would expect the Enacted Map to elect one fewer Democrat (meaning 5 rather than 6 in this cluster) than the 25th percentile simulation in approximately 3 of these 5 elections, on average. In other words, the difference across this range of electoral environments is Republicans picking up an additional seat roughly 3 in 5 times.

Dr. Mattingly's presents simulations that contain four districts that are solidly Democratic in which no simulation nor the Enacted Plan produce a Republican-leaning seat (see Figure 6.2.4 in Dr. Mattingly's report). The simulations also contain two seats (SD-13 and

SD-17) in which a majority of the simulations produce a Republican-leaning seat (4 of the 12 elections considered) and in other elections produce a Democratic-leaning seat (5 of the 12 elections considered). In some cases the majority of simulations in SD-13 and SD-17 diverge with one district being majority Republican and the other producing a majority of the simulations generating a Democratic district (3 of the 12 elections). In the most Republican district the Enacted Plan agrees with the majority of the simulations in 10 of the 12 elections considered and in the second most Republican district there is agreement in 9 of the 12 elections considered.

7.5 Iredell-Mecklenburg Senate County Grouping

The Iredell and Mecklenburg Senate county cluster contains 6 districts, SD-37, SD-38, SD-39, SD-40, SD-41, and SD-42.

Dr. Pegden's analysis contend that the Enacted Plan is a statistical outlier. He states, 'My theorems imply that the enacted districting is among the most optimized-for-partisanship 0.0057% of all alternative districtings satisfying my districting criteria (in other words, 99.9943% are less optimized-for-partisanship) (pg. 32)."

However, the substantive difference in the expected Democratic seat share is much smaller. The Enacted Map has an expected Democratic seats generated from the uniform swing analysis of 4.67 seats while the 25th percentile plan has an expected number of Democratic seats of 4.85. This leads to a substantive difference of 0.18 expected Democratic seats. In other words, across 5 hypothetical elections of each district in the cluster, we would expect the Enacted Map to elect one fewer Democrat (meaning 4 rather than 5 in this cluster) than the 25th percentile simulation in approximately 1 of these 5 elections, on average. Put another way, the difference across this range of electoral environments is Republicans picking up an additional seat roughly 1 in 5 times.

Dr. Mattingly's simulations in this cluster contain four districts that are solidly Democratic in which no majority of his simulations nor the Enacted Plan produce a Republican-

leaning seat (see Figure 6.2.1 in Dr. Mattingly's report). The simulations also contain one seat (SD-37) in which a majority of the simulations produce a heavily Republican-leaning seat in all 12 elections. The Enacted Plan is in total agreement with the majority of simulations in these districts. This leaves SD-41, which is a more competitive seat in the simulations. In 9 of the 12 elections considered the partisan outcome in the Enacted Plan matches the partisan outcome in the majority of the simulations by producing a majority of the two-party vote share for the Democratic candidate.

AFFIDAVIT OF SEAN P. TRENDE

Now comes affiant Sean P. Trende, having been first duly cautioned and sworn, deposes and states as follows:

1. I am over the age of 18 and am competent to testify regarding the matters discussed below.

2. For the purposes of this litigation, I have been asked by counsel for Legislative Defendants to analyze relevant data and provide my expert opinions.

3. To that end, I have personally prepared the rebuttal report attached to this affidavit as Exhibit A, and swear to its authenticity and to the faithfulness of the opinions.

FURTHER THE AFFIANT SAYETH NAUGHT.

NCLCV v. Hall
21 CVS 15426
LDTX111

Executed on 28 December, 2021.

Sean P. Trende

Sean P. Trende

STATE OF FLORIDA

COUNTY OF PINELLAS

Sworn to and subscribed before me by online notarization this 28th day of December, 2021, by SEAN P. TRENDE, who appeared by way of two-way audio/video communication technology, and he provided his Ohio driver's license as identification.

My Commission Expires June 30, 2022

Online Notary Public. This notarial act involved the use of online audio/video communication technology.

Exhibit A

EXPERT REBUTTAL REPORT OF SEAN TRENDE

Now comes affiant Sean P. Trende, having been first duly cautioned and sworn, deposes and states as follows:

1. I am over the age of 18 and am competent to testify regarding the matters discussed below.

2. I currently reside at 1146 Elderberry Loop, Delaware, OH 43015. My e-mail is trende.3@buckeyemail.osu.edu.

3. I have been retained in this matter by the Legislative Defendants, and am being compensated at $400.00 per hour for my work in this case.

4. My *curriculum vitae* is attached to this report as Exhibit 1.

EXPERT CREDENTIALS

5. I am currently enrolled as a doctoral candidate in political science at The Ohio State University. I have completed all of my coursework and have passed comprehensive examinations in both methods and American Politics. My coursework for my Ph.D. and M.A.S. included, among other things, classes on G.I.S. systems, spatial statistics, issues in contemporary redistricting, machine learning, non-parametric hypothesis tests and probability theory. I expect to receive my Ph.D. in May of 2021. My dissertation focuses on applications of spatial statistics to political questions.

6. I joined RealClearPolitics in January of 2009 after practicing law for eight years. I assumed a fulltime position with RealClearPolitics in March of 2010. My title is Senior Elections Analyst. RealClearPolitics is a company of around 40 employees, with offices in Washington D.C. It produces one of the most heavily trafficked political websites in the world, which serves as a one-stop shop for political analysis from all sides of the political spectrum

and is recognized as a pioneer in the field of poll aggregation. It produces original content, including both data analysis and traditional reporting. It is routinely cited by the most influential voices in politics, including David Brooks of *The New York Times*, Brit Hume of *Fox News*, Michael Barone of *The Almanac of American Politics*, Paul Gigot of *The Wall Street Journal*, and Peter Beinart of *The Atlantic*.

7. My main responsibilities with RealClearPolitics consist of tracking, analyzing, and writing about elections. I collaborate in rating the competitiveness of Presidential, Senate, House, and gubernatorial races. As a part of carrying out these responsibilities, I have studied and written extensively about demographic trends in the country, exit poll data at the state and federal level, public opinion polling, and voter turnout and voting behavior.

8. In particular, understanding the way that districts are drawn and how geography and demographics interact is crucial to predicting United States House of Representatives races, so much of my time is dedicated to that task.

9. I am currently a Visiting Scholar at the American Enterprise Institute, where my publications focus on the demographic and coalitional aspects of American Politics. My first paper focused on the efficiency gap, a metric for measuring the fairness of redistricting plans.

10. I am the author of *The Lost Majority: Why the Future of Government is up For Grabs and Who Will Take It.* In this book, I explore realignment theory. It argues that realignments are a poor concept that should be abandoned. As part of this analysis, I conducted a thorough analysis of demographic and political trends beginning in the 1920s and continuing through the modern times, noting the fluidity and fragility of the coalitions built by the major political parties and their candidates.

11. I co-authored the 2014 *Almanac of American Politics*. The Almanac is considered the foundational text for understanding congressional districts and the representatives of those districts, as well as the dynamics in play behind the elections. PBS's Judy Woodruff described the book as "the oxygen of the political world," while NBC's Chuck Todd noted that "[r]eal political junkies get two *Almanacs*: one for the home and one for the office." My focus was researching the history of and writing descriptions for many of the newly-drawn districts, including tracing the history of how and why they were drawn the way that they were drawn.

12. I have spoken on these subjects before audiences from across the political spectrum, including at the Heritage Foundation, the American Enterprise Institute, the CATO Institute, the Bipartisan Policy Center, and the Brookings Institution. In 2012, I was invited to Brussels to speak about American elections to the European External Action Service, which is the European Union's diplomatic corps. I was selected by the United States Embassy in Sweden to discuss the 2016 elections to a series of audiences there, and was selected by the United States Embassy in Spain to fulfil a similar mission in 2018. I was invited to present by the United States Embassy in Italy, but was unable to do so because of my teaching schedule.

13. In the winter of 2018, I taught American Politics and the Mass Media at Ohio Wesleyan University. I taught Introduction to American Politics at The Ohio State University for three semesters from Fall of 2018 to Fall of 2019. In the Springs of 2020 and 2021, I taught Political Participation and Voting Behavior at The Ohio State University. This course spent several weeks covering all facets of redistricting: How maps are drawn, debates over what constitutes a fair map, measures of redistricting quality, and similar topics.

14. It is my policy to appear on any major news outlet that invites me, barring scheduling conflicts. I have appeared on both Fox News and MSNBC to discuss electoral and

demographic trends. I have been cited in major news publications, including *The New York Times*, *The Washington Post*, *The Los Angeles Times*, *The Wall Street Journal*, and *USA Today*.

15. I sit on the advisory panel for the "States of Change: Demographics and Democracy" project. This project is sponsored by the Hewlett Foundation and involves three premier think tanks: The Brookings Institution, the Bipartisan Policy Center, and the Center for American Progress. The group takes a detailed look at trends among eligible voters and the overall population, both nationally and in key states, to explain the impact of these changes on American politics, and to create population projections, which the Census Bureau abandoned in 1995. In 2018, I authored one of the lead papers for the project: "In the Long Run, We're All Wrong," available at https://bipartisanpolicy.org/wp-content/uploads/2018/04/BPC-Democracy-States-of-Change-Demographics-April-2018.pdf.

16. I previously authored an expert report in *Dickson v. Rucho*, No. 11-CVS-16896 (N.C. Super Ct., Wake County), which involved North Carolina's 2012 General Assembly and Senate maps. Although I was not called to testify, it is my understanding that my expert report was accepted without objection. I also authored an expert report in *Covington v. North Carolina*, Case No. 1:15-CV-00399 (M.D.N.C.), which involved almost identical challenges in a different forum. Due to what I understand to be a procedural quirk, where my largely identical report from *Dickson* had been inadvertently accepted by the plaintiffs into the record when they incorporated parts of the *Dickson* record into the case, I was not called to testify.

17. I authored two expert reports in *NAACP v. McCrory*, No. 1:13CV658 (M.D.N.C.), which involved challenges to multiple changes to North Carolina's voter laws, including the elimination of a law allowing for the counting of ballots cast in the wrong precinct. I was

admitted as an expert witness and testified at trial. My testimony discussed the "effect" prong of the Voting Rights Act claim. I did not examine the issues relating to intent.

18. I authored reports in *NAACP v. Husted*, No. 2:14-cv-404 (S.D. Ohio), and *Ohio Democratic Party v. Husted*, Case 15-cv-01802 (S.D. Ohio), which dealt with challenges to various Ohio voting laws. I was admitted and testified at trial in the latter case (the former case settled). The judge in the latter case ultimately refused to consider one opinion, where I used an internet map-drawing tool to show precinct locations in the state. Though no challenge to the accuracy of the data was raised, the judge believed I should have done more work to check that the data behind the application was accurate.

19. I served as a consulting expert in *Lee v. Virginia Board of Elections*, No. 3:15-cv-357 (E.D. Va. 2016), a voter identification case. Although I would not normally disclose consulting expert work, I was asked by defense counsel to sit in the courtroom during the case and review testimony. I would therefore consider my work *de facto* disclosed.

20. I filed an expert report in *Mecinas v. Hobbs*, No. CV-19-05547-PHX-DJH (D. Ariz. 2020). That case involved a challenge to Arizona's ballot order statute. Although the judge ultimately did not rule on a motion in limine in rendering her decision, I was allowed to testify at the hearing.

21. I authored two expert reports in *Feldman v. Arizona*, No. CV-16-1065-PHX-DLR (D. Ariz.). Plaintiffs in that case challenged an Arizona law prohibiting the collection of voted ballots by third parties that were not family members or caregivers and the practice of most of the state's counties to require voters to vote in their assigned precinct. My reports and testimony were admitted. Part of my trial testimony was struck in that case for reasons unrelated to the merits of the opinion; counsel for the state elicited it while I was on the

witness stand and it was struck after Plaintiffs were not able to provide a rebuttal to the new evidence.

22. I authored an expert report in *Smith v. Perrera*, No. 55 of 2019 (Belize). In that case I was appointed as the court's expert by the Supreme Court of Belize. In that case I was asked to identify international standards of democracy as they relate to malapportionment claims, to determine whether Belize's electoral divisions (similar to our congressional districts) conformed with those standards, and to draw alternative maps that would remedy any existing malapportionment.

23. I authored expert reports in *A. Philip Randolph Institute v. Smith*, No. 1:18-cv-00357-TSB (S.D. Ohio), *Whitford v. Nichol*, No. 15-cv-421-bbc (W.D. Wisc.), and *Common Cause v. Rucho*, NO. 1:16-CV-1026-WO-JEP (M.D.N.C.), which were efficiency gap-based redistricting cases filed in Ohio, Wisconsin and North Carolina.

24. I also authored an expert report in the cases of *Ohio Organizing Collaborative, et al v. Ohio Redistricting Commission, et al* (No. 2021-1210); *League of Women Voters of Ohio, et al v. Ohio Redistricting Commission, et al* (No. 2021-1192); *Bria Bennett, et al v. Ohio Redistricting Commission, et al* (No. 2021-1198). These cases are pending in original action before the Supreme Court of Ohio.

25. I currently serve as one of two special masters appointed by the Supreme Court of Virginia to redraw the districts that will elect the commonwealth's representatives to the House of Delegates, state Senate, and U.S. Congress.

SUMMARY OF WORK PERFORMED

26. I certify that the images attached as Exhibit 2 are true and correct copies of images that I created and that I describe below.

27. To create these images, I first examined the Complaints filed by plaintiffs in this action. I examined whether districts were challenged as either partisan gerrymanders or districts that diluted minority voting power. If I determined a district was challenged, I coded it as a "1."

28. I then downloaded shapefiles for the enacted Congressional, State Senate and House of Representatives from the legislative redistricting website, https://www.ncleg.gov/Redistricting.

29. Using R, a widely utilized statistical programming tool with which I have extensive familiarity through work and coursework, I color-coded the districts by plaintiff group, based upon who challenged which districts. This produced the accompanying maps.

EXHIBIT
1

2016 Contingent Congressional Plan Committee Adopted Criteria

Equal Population

The Committee will use the 2010 federal decennial census data as the sole basis of population for the establishment of districts in the 2016 Contingent Congressional Plan. The number of persons in each congressional district shall be as nearly as equal as practicable, as determined under the most recent federal decennial census.

Contiguity

Congressional districts shall be comprised of contiguous territory. Contiguity by water is sufficient.

Political data

The only data other than population data to be used to construct congressional districts shall be election results in statewide contests since January 1, 2008, not including the last two presidential contests. Data identifying the race of individuals or voters shall not be used in the construction or consideration of districts in the 2016 Contingent Congressional Plan. Voting districts ("VTDs") should be split only when necessary to comply with the zero deviation population requirements set forth above in order to ensure the integrity of political data.

Partisan Advantage

The partisan makeup of the congressional delegation under the enacted plan is 10 Republicans and 3 Democrats. The Committee shall make reasonable efforts to construct districts in the 2016 Contingent Congressional Plan to maintain the current partisan makeup of North Carolina's congressional delegation.

Twelfth District

The current General Assembly inherited the configuration of the Twelfth District from past General Assemblies. This configuration was retained because the district had already been heavily litigated over the past two decades and ultimately approved by the courts. The Harris court has criticized the shape of the Twelfth

NCLCV v. Hall
21 CVS 15426
LDTX112

District citing its "serpentine" nature. In light of this, the Committee shall construct districts in the 2016 Contingent Congressional Plan that eliminate the current configuration of the Twelfth District.

Compactness

In light of the Harris court's criticism of the compactness of the First and Twelfth Districts, the Committee shall make reasonable efforts to construct districts in the 2016 Contingent Congressional Plan that improve the compactness of the current districts and keep more counties and VTDs whole as compared to the current enacted plan. Division of counties shall only be made for reasons of equalizing population, consideration of incumbency and political impact. Reasonable efforts shall be made not to divide a county into more than two districts.

Incumbency

Candidates for Congress are not required by law to reside in a district they seek to represent. However, reasonable efforts shall be made to ensure that incumbent members of Congress are not paired with another incumbent in one of the new districts constructed in the 2016 Contingent Congressional Plan.

EXHIBIT
3

2017 HOUSE AND SENATE PLANS CRITERIA

Equal Population. The Committees shall use the 2010 federal decennial census data as the sole basis of population for drawing legislative districts in the 2017 House and Senate plans. The number of persons in each legislative district shall comply with the +/- 5 percent population deviation standard established by *Stephenson v. Bartlett*, 355 N.C. 354, 562 S.E. 2d 377 (2002).

Contiguity. Legislative districts shall be comprised of contiguous territory. Contiguity by water is sufficient.

County Groupings and Traversals. The Committees shall draw legislative districts within county groupings as required by *Stephenson v. Bartlett*, 355 N.C. 354, 562 S.E. 2d 377 (2002) (*Stephenson I*), *Stephenson v. Bartlett*, 357 N.C. 301, 582 S.E.2d 247 (2003) (*Stephenson II*), *Dickson v. Rucho*, 367 N.C. 542, 766 S.E.2d 238 (2014) (*Dickson I*) and *Dickson v. Rucho*, 368 N.C. 481, 781 S.E.2d 460 (2015) (*Dickson II*). Within county groupings, county lines shall not be traversed except as authorized by *Stephenson I*, *Stephenson II*, *Dickson I*, and *Dickson II*.

Compactness. The Committees shall make reasonable efforts to draw legislative districts in the 2017 House and Senate plans that improve the compactness of the current districts. In doing so, the Committees may use as a guide the minimum Reock ("dispersion") and Polsby-Popper ("perimeter") scores identified by Richard H. Pildes and Richard G. Neimi in *Expressive Harms, "Bizarre Districts," and Voting Rights: Evaluating Election-District Appearances After Shaw v. Reno*, 92 Mich. L. Rev. 483 (1993).

Fewer Split Precincts. The Committees shall make reasonable efforts to draw legislative districts in the 2017 House and Senate plans that split fewer precincts than the current legislative redistricting plans.

Municipal Boundaries. The Committees may consider municipal boundaries when drawing legislative districts in the 2017 House and Senate plans.

Incumbency Protection. Reasonable efforts and political considerations may be used to avoid pairing incumbent members of the House or Senate with another incumbent in legislative districts drawn in the 2017 House and Senate plans. The Committees may make reasonable efforts to ensure voters have a reasonable opportunity to elect non-paired incumbents of either party to a district in the 2017 House and Senate plans.

Election Data. Political considerations and election results data may be used in the drawing of legislative districts in the 2017 House and Senate plans.

No Consideration of Racial Data. Data identifying the race of individuals or voters shall not be used in the drawing of legislative districts in the 2017 House and Senate plans.

Joint Meeting of Committees

August 12, 2021

House Committee on Redistricting

Senate Committee on Redistricting and Elections

Criteria Adopted by the Committees

- **Equal Population.** The Committees will use the 2020 federal decennial census data as the sole basis of population for the establishment of districts in the 2021 Congressional, House, and Senate plans. The number of persons in each legislative district shall be within plus or minus 5% of the ideal district population, as determined under the most recent federal decennial census. The number of persons in each congressional district shall be as nearly as equal as practicable, as determined under the most recent federal decennial census.

- **Contiguity.** No point contiguity shall be permitted in any 2021 Congressional, House, and Senate plan. Congressional, House, and Senate districts shall be compromised of contiguous territory. Contiguity by water is sufficient.

- **Counties, Groupings, and Traversals.** The Committees shall draw legislative districts within county groupings as required by *Stephenson v. Bartlett*, 355 N.C. 354, 562 S.E.2d 377 (2002) (*Stephenson I*), *Stephenson v. Bartlett*, 357 N.C. 301, 582 S.E.2d 247 (2003) (*Stephenson II*), *Dickson v. Rucho*, 367 N.C. 542, 766 S.E.2d 238 (2014) (*Dickson I*) and *Dickson v. Rucho*, 368 N.C. 481, 781 S.E. 2d 460 (2015) (*Dickson II*). Within county groupings, county lines shall not be traversed except as authorized by *Stephenson I*, *Stephenson II*, *Dickson I*, and *Dickson II*.

  Division of counties in the 2021 Congressional plan shall only be made for reasons of equalizing population and consideration of double bunking. If a county is of sufficient population size to contain an entire congressional district within the county's boundaries, the Committees shall construct a district entirely within that county.

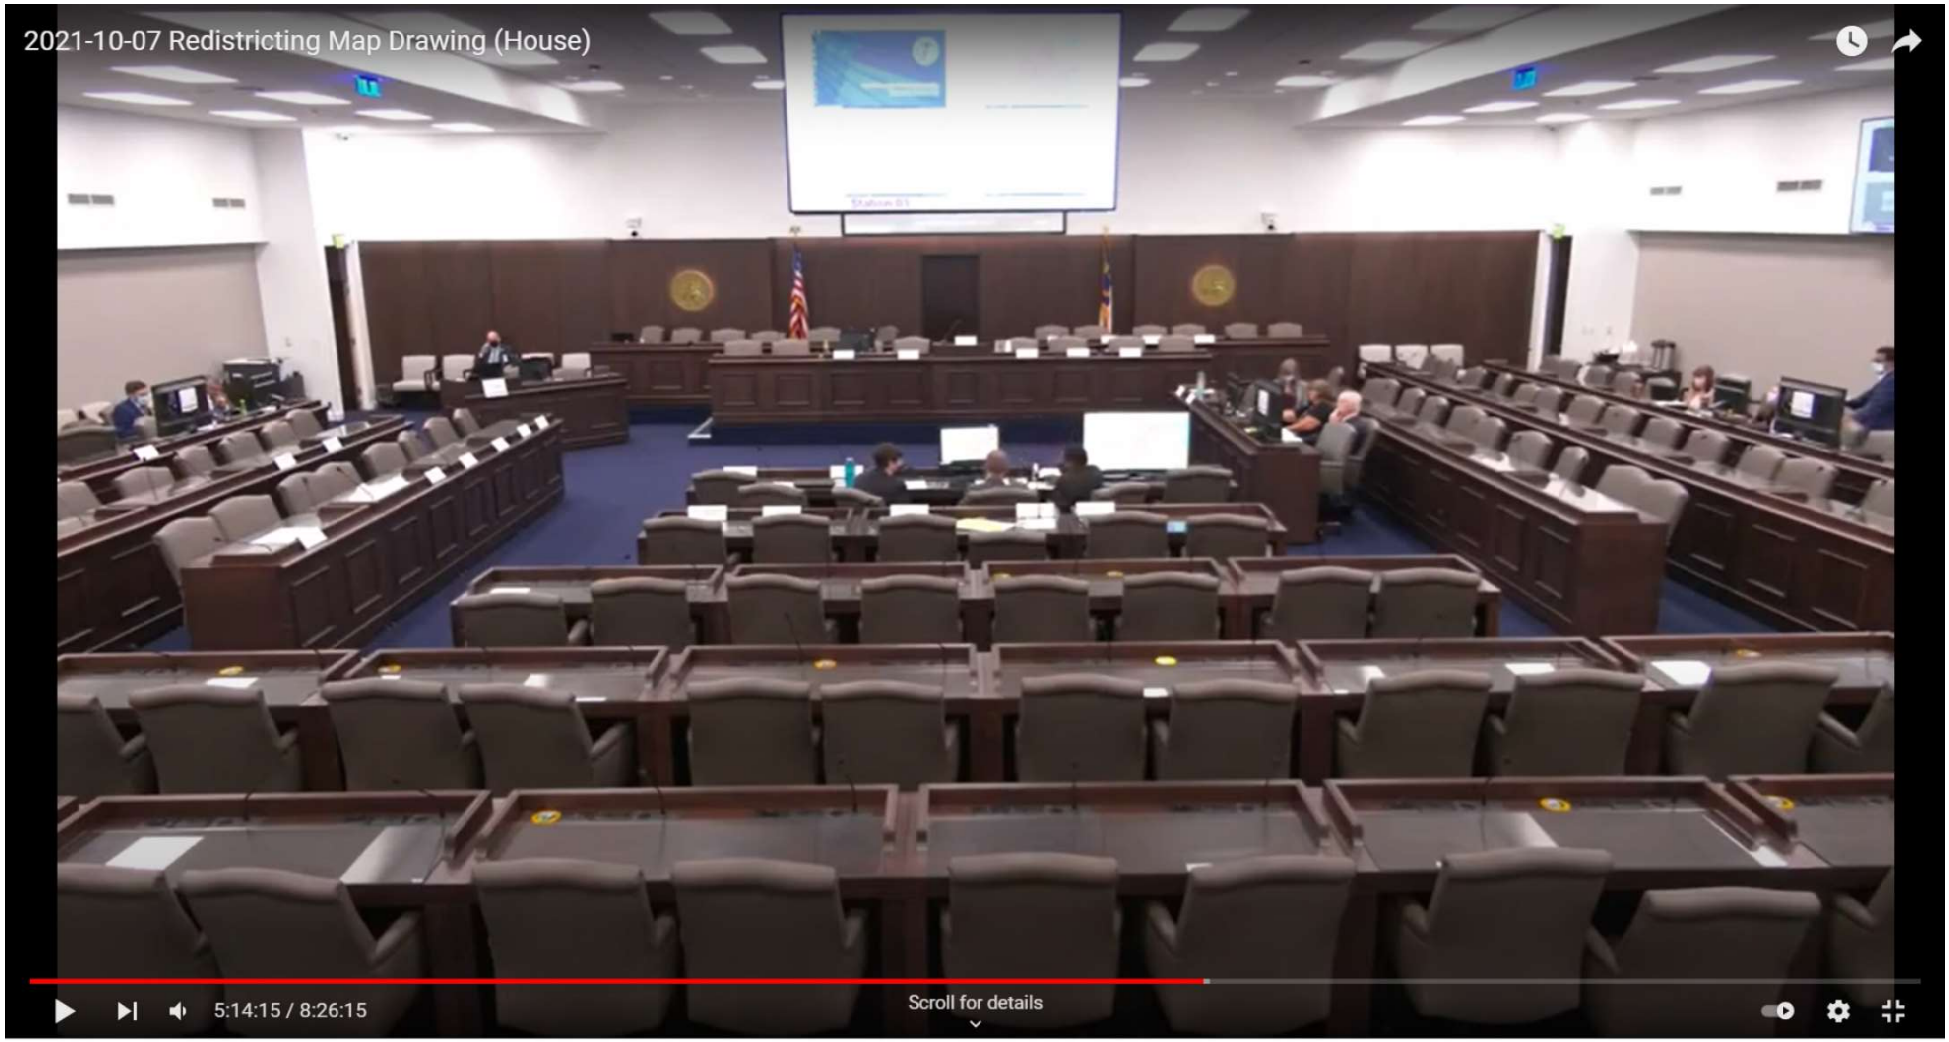
- **Racial Data.** Data identifying the race of individuals or voters *shall not* be used in the construction or consideration of districts in the 2021 Congressional, House, and Senate plans. The Committees will draw districts that comply with the Voting Rights Act.

- **VTDs.** Voting districts ("VTDs") should be split only when necessary.

- **Compactness.** The Committees shall make reasonable efforts to draw legislative districts in the 2021 Congressional, House and Senate plans that are compact. In doing so, the Committee may use as a guide the minimum Reock ("dispersion") and Polsby-Popper ("permiter") scores identified by Richard H. Pildes and Richard G. Neimi in *Expressive Harms, "Bizarre Districts," and Voting Rights: Evaluating Election-District Appearances After Shaw v. Reno*, 92 Mich. L. Rev. 483 (1993).

- **Municipal Boundaries.** The Committees may consider municipal boundaries when drawing districts in the 2021 Congressional, House, and Senate plans.

NCLCV v. Hall
21 CVS 15426
LDTX114



- **Election Data.** Partisan considerations and election results data *shall not* be used in the drawing of districts in the 2021 Congressional, House, and Senate plans.

- **Member Residence.** Member residence may be considered in the formation of legislative and congressional districts.

- **Community Consideration.** So long as a plan complies with the foregoing criteria, local knowledge of the character of communities and connections between communities may be considered in the formation of legislative and congressional districts.

Joint Meeting of Committees

August 18, 2021

House Committee on Redistricting

Senate Committee on Redistricting and Elections

Proposed Redistricting Process

1. **Start the Redistricting Process Immediately Upon Legacy Data Release.** The Committees should begin the redistricting process by utilizing the Legacy Format Summary File of P.L. 94-171 data. General Assembly central staff should start processing the legacy format data immediately upon release of that data by the U.S. Census Bureau.

2. **Provide Redistricting Information on the NCGA Website.** To facilitate public comment and participation, the General Assembly should maintain the existing redistricting webpage, clearly bookmarked from the home page of the NCGA website, containing all redistricting information in one location, including the following: meeting notices, livestream links, draft maps and any related data and information, and a public comment portal. This webpage should also include an up-to-date posting of the public comments received via the public comment portal.

3. **Permit Written and Oral Public Comment.** The Committees should ensure all North Carolinians have an opportunity to provide public comment to the members of the Committees regarding redistricting. The Committees should receive public comment in accordance with the following:
   a. Through a public comment portal, email, and the U.S. Postal Service. Information about how North Carolinians can submit public input should be provided contemporaneously with any Redistricting committee meeting notices.
   b. Before any draft maps are drawn and before final proposed maps are voted on by the Committees.

4. **Ensure Quality Video and Audio Broadcast in Public Meetings.** The Committees should strive to ensure that video and audio of Committee meetings related to map drawing are timestamped and of a quality such that the public can view relevant details of the proposed maps and hear relevant discussion. Committee notices should include a contact phone number for those observing the process to report technical issues. The Committees should halt map drawing until any technical issues that prevent public observation are resolved.

5. **Hold Accessible Public Hearings Throughout the State.** The Committees should provide live in-person hearings in areas throughout the State for community members to provide live testimony. In scheduling the public hearings, the Committees should comply with the following:
   a. The Committees should conduct at least thirteen hearings, accounting for one from each of the 2019 Congressional districts. Consideration should be given to locations and facilities that are accessible by public transport and to those with disabilities.
   b. The Committees should provide remote options for viewing public hearings and for providing public comment where it is technologically feasible to do so.
   c. The Committees should endeavor to post a full schedule of public hearings at the beginning of the redistricting process, and in any event provide at least two weeks' notice of any public hearing on redistricting. Public hearings should not be scheduled during or near public holidays, such as Labor Day.

House Committee on Redistricting
Senate Committee on Redistricting and Elections

6. **Disclose All Third Parties Involved in Redistricting.** The Committees should immediately disclose all consultants and counsel to members and committees of either house of the General Assembly who are paid by State funds who will be participating in the redistricting process. Such disclosure should occur within 24 hours of adoption of this criteria or engagement, whichever occurs first.

7. **Committee Consideration of Maps.** The Committees should consider only maps that comply with all of the following:
   a. Any criteria, systems, or data used in developing the map was disclosed to the public in advance of its use in a manner that allows the public to have a reasonable and adequate opportunity to view the information.
   b. The map was released online for public comment, and the public had adequate time to review the map and to submit public comment on the map before it is considered by the Committee or revised by the Committee.
   c. The map was drawn in the public view, including a live-stream of the drawing.
   d. Written documentation justifying the districts chosen was released online with the map for public viewing.

8. **Disclose Initial Draft Maps.** After receiving and incorporating public comment, draft maps should be released online for additional public comment within 30 days of when the Committees begin drawing maps.

9. **Submit Final Proposed Maps to the General Assembly.** The final proposed maps should be publicly released online no later than 21 days after the draft maps are released. The Committees should deliver the final proposed bill containing the map to the appropriate Chamber within 10 days of the release of the final proposed maps.

UNKNOWN MALE: House Committee on Redistricting, Tuesday, October 5, 2021, 643 LOB.

CHAIRMAN HALL: Committee will come to order. The Chair apologizes for delay in getting started this afternoon. Thanks to the committee members for their patience.

Members, I want to start off by thanking you all, the members, staff, and the public who chose to participate in our public hearings across the state over the last several weeks. I think we heard varying opinions. It was great to see folks engaged, and we had members, many -- many member, not even just the folks on this committee, but several members of the House and the Senate, who are not on this committee, who attended those meetings and gave folks a chance to be heard about what they want this process to look like.

The purpose of today's meeting is to -- just to do some Housekeeping to give folks an idea of what the map-drawing process is going to look like. And we anticipate, beginning tomorrow, starting the map-drawing process, and so we want to lay out very clearly what the criteria will be -- or rather the rules will be for this committee for drawing maps.

So we'll just jump right into it. We're going to have four terminals. And if you look around this room, you see the big screens. There are going to be four of those. One will be dedicated to the chair of this committee. One will be dedicated to the minority leader, or his designee. I should have said on the first station, it will be dedicated to the chairman or chair's designee. And then the other two will be for any other committee member, or any member of the House who wishes to come in and draw on those terminals.

For now, the plan is to go from 9:00 to 5:00 each day. So we'll come in, gavel in at 9 o'clock. This committee room will stay open throughout the day. Those of you who have been through this before, you know it's not like a typical committee where we're always with a chair standing up here, like I am right now. What we typically do, we'll gavel in, and folks can go draw.

We may take breaks throughout the day. We may just leave the committee room open. We want to be cognizant of staff, let them be able to eat lunch, and that sort of thing, so we may take a few breaks and there. But by and large, the committee room is going to be open from 9:00 to 5:00. We're

going to plan to do that Monday through Friday, for now.

So, as of right now, chair anticipates having this committee room open throughout the rest of this week, until Friday at 5 o'clock. But the chair will say that if significant progress is made, we may not keep the committee open all day on Friday, so that we don't have to keep staff here. And obviously, folks will be -- members will be traveling back to their districts. To prevent them from having to travel back on Friday night, we may go ahead and may not have a committee meeting Friday or may end the committee early on Friday. So just wait and see on that front.

And this is a rule that I want to make sure all members are clear on, but this committee, and the House as a whole, will only consider maps that are drawn in this committee room, on one of the four stations. So if a map is not drawn on one of these four stations, in this committee room, during those committee hours that the committee is open, then those maps will not be considered for a vote by this committee, and of course, will not be considered for a vote by the House.

And we'll be able to know because when you

put a map into one of these computers, that becomes a matter of public record, and we can tell which were drawn on these computers. It has to be drawn in this committee room.

When this committee is open, we'll maintain a live stream and live audio during the whole time of map-drawing, so that the process will be, we believe, just about as transparent as we humanly can do. And that's what we heard in public comment. We heard folks say, "We want a transparent process."

Well, that's what we're going to give the public. We're going to give the members of this body and the public a transparent process where we draw maps in this room with a live audio feed and a live video feed. And we're going to create a rule that we're only going to consider the maps that are drawn in this room, in the House, in this committee, and ultimately, in the House.

Members, we're going to continue to have session, of course, regular session, throughout this process. As the members know, we're still dealing with the budget right now. And so, obviously, the speaker is aware that this process of redistricting takes a lot of labor, and we'll give us ample time to do that. But we have to continue with the

business of the House in general, so we'll do just the best we can on that, understanding we're operating under a tight time line.

And we've talked about that a lot throughout this committee process that, because of the delay in the census data, we're just now getting to a point where we can draw these maps, after doing the public comment we wanted to do. But with filing coming in December, we really need to get these maps drawn as close as we can, or at least by the end of this month, if not sooner.

That's going to be our goal to try to get these things done by the end of the month. That way we can give the board of elections time to get ballots printed and let folks know what districts they're going to be in, so they can decide if they want to run or not run. Whether they be members of this committee, or folks who are not in the General Assembly at all.

Members, with that being said --

REPRESENTATIVE RICHARDSON: Mr. Chairman, can I have a quick question?

CHAIRMAN HALL: I'm going to take questions in a little while, but you know, if it's something that's really important right now, okay. All right.

I'm going to take questions at the end.

So for ground rules, that's it for now. I may have left something out, and if so, members can ask me in a moment.

The second step in today's committee is going to be the presentation of the optimum county groupings that have been come up with by the non-partisan staff. And so the chair is going to turn this over to Erika Churchill, in just a moment, to make a presentation on the optimum county groupings that have been crafted by the non-partisan staff.

But what the chair will ultimately say about these groupings is: in years past, if you've been on this committee, you know that we have adopted certain groupings. Chair does not anticipate adopting any particular grouping this time around because there are multiple options within the county groupings. And that's what you've got in front of you, and that Ms. Churchill is going to explain in more detail here in just a bit.

Rather than limit any member of this committee into just certain groupings, what the chair anticipates is that members can use whichever combination of the groupings that you see before you, in drawing whichever map a member sees fit to

draw.

The only groupings that will be considered are those that are in the packet that's in front of you. These were initially put forth by Duke University, and a non-partisan staff has also drawn their own groupings and confirmed that the Duke groupings were correct. And so we're confident that using the algorithm, as required in the law, that these are the possible groupings -- the possible optimum groupings.

Again, I'll answer questions momentarily on that front. But with that, the chair is going to turn it over to Erika Churchill to speak to the county groupings and to also show an example of how to use the terminals when drawing the maps.

Ms. Churchill, you're recognized.

MS. CHURCHILL: Thank you, Mr. Chair. As you mentioned, central staff, were asked to take a presentation by Christopher Cooper, Blake Esselstyn, Gregory Herschlag, Jonathan Mattingly, and Rebecca Tippett from the quantifying gerrymandering group, which is a non-partisan research group centered at Duke Math.

And they produced a paper entitled, "North Carolina General Assembly County Clusterings from

the 2020 Census." It was posted by Mr. Herschlag on August 17, 2021. And we took it as a recipe, because throughout this, they gave instructions as to what they believed were the optimum county groupings.

I would note that they particularly say, "However, there are often multiple optimal county clusterings that minimize county splitting." And they reference two other blogs that they have posted. The release of the 2020 census data allows us to determine the possible county clusterings for both the North Carolina State House and State Senate redistricting processes.

The one part of Stephenson v. Bartlett which this analysis does not reflect, is compliance with the Voting Rights Act. To determine the county clusters, we used the implementation of the court order procedure described in Carter, et al." The site they gave for Carter, et al. is "Optimal Legislative County Clustering in North Carlina" by Daniel Carter, Zach Hunter, Dan Teague, Gregory Herschlag, and Jonathan Mattingly. Statistics and Public Policy Volume 7, 2020.

For the state House, what you have before you in hardcopy, on the screen, and I believe they

will be posted to the web, are the nine maps that resulted from this paper with respect to the North Carolina State House. The very first one does not have the entire state assigned. They call this the fixed groupings. Throughout the maps that we'll go through, you will find that these will be hash tagged. A little bit of crosshatching on them to identify these are the ones that this particular group say are the optimal.

They created 33 clusters containing 107 of the 120 districts that are fixed based on determining optimal county clusters. 11 of these clusters contain 1 district, meaning that 11 of the 120 House districts are fixed.

So as you're looking at the map, whether in hardcopy or online, you will see that there is a letter assigned to each. I'm just going to pick on Carteret and Craven, in the eastern part of the state, in the blue shading, it is Q2. The Q is just an easy letter reference if you need to talk about that particular grouping with anyone. The 2 means that that is population sufficient for 2 House members. The same if you look just to the left, in the gray, the green Lenore Jones BB cluster, or grouping, has a 1 underneath it, meaning that would

be a single member grouping.

So the white areas that are left can each be assigned two different ways. So that would get you to the lovely House maps that are left.

(Sound interruption)

So starting with the Western area that was left kind of unassigned, needs to be grouped. As you will see it on the Duke House 01 map, it would be districts HH and II. The first option here would be to combine Surry, Wilkes, and Alexander to create a two-member district. And Alleghany, Ashe, Watauga, and Caldwell to create a two-member district.

If you will skip over to Duke House 05, this would give you a visual of the second option for this particular grouping. It would be a combination of Surry, Alleghany, Ashe, and Wilkes for a two-member grouping. And Watauga, Caldwell, and Alexander for a two-member grouping.

Staying on the Duke House 05, and heading east to the southeast, the options in that southeast area here would be to combine Wayne and Sampson into a two-member district. Duplin and Onslow into a three-member district. And Pender and Bladen into a one-member district.

And so if you just fast forward one to Duke House 08, the second option in the southeastern corner would be to combine Wayne and Duplin into a two-member district. Sampson and Bladen into a one-member district and Onslow and Pender into a three-member district.

Duke House 05 will be our example of the northeastern corner. Option one would be to combine Hertford, Gates, Pasquotank, and Camden into a single-member district. And Currituck, Dare, Hyde, Pamlico, Beaufort, Washington, Tyrrell, Perquimans, and Chowan into a two-member district.

The other option in the northeastern corner, if you will go to Duke House 06, you can see a visual of that. The single member district would be Currituck, Pasquotank, Perquimans, and Tyrrell. The two-member district would be Beaufort, Pamlico, Hyde, Dare, Washington, Chowan, Camden, Gates, and Hertford.

Each of the multimember districts throughout all of these would need to be divided into single-member districts for compliance with Stephenson opinion.

I should probably note, just so that everybody is aware, the ideal population for a North

Carolina House district is 86,995 people, according to the 2020 Decennial Census, with a plus or minus 5 percent deviation. That leaves a range of 82,645 to 91,345 people.

CHAIRMAN HALL: Okay, members. The chair is going to give Ms. Churchill an opportunity in a moment to display and give an example of how the terminals will work.

But if that is it for your presentation on groupings, if you'll stand there for just a second.

MS. CHURCHILL: Yes, sir.

CHAIRMAN HALL: Committee members, do any members have any questions for legislative staff at this point about groupings? And again, chair's going to take some questions at the end.

Representative Torbett.

REPRESENTATIVE TORBETT: Just if she could repeat the numbers she used there at the last time. There was three. There was a total and the range.

MS. CHURCHILL: Okay. Ideal population for a North Carolina House of Representatives districts, 86,995. Creating a plus or minus 5 percent range of 82,645 to 91,345 people.

CHAIRMAN HALL: The chair is going to make sure that all committee members have a document

showing the ideal population for each level of grouping. So for one-member grouping, two-member. And I know we've had that in the past, and it may have already been passed out at one of the meetings we've had. So let's make sure, if we will -- we'll send that out to the committee via email, and we'll have some paper copies at the meeting tomorrow.

MS. CHURCHILL: We will actually have a laminated copy at every station.

CHAIRMAN HALL: Okay, great.

MS. CHURCHILL: And we will also be glad to email that out to everyone. It has been passed out at a previous meeting.

CHAIRMAN HALL: And we're going to go ahead and have paper copies for folks to be able to take with them if they want to.

MS. CHURCHILL: Glad to take care of that.

CHAIRMAN HALL: Representative Harrison.

REPRESENTATIVE HARRISON: Thank you, Mr. Chair. Thank you, Erika.

If I heard you right, so did you -- when you started -- and I've got the article in front of me from Doctors Mattingly, et al. -- did you say that the fixed -- the fixed clusters -- we're working from a basis of the fixed clusters, and

those represent 107 of the 120 members; is that right?

MS. CHURCHILL: Yes, ma'am.

REPRESENTATIVE HARRISON: And then our options are to figure out how to manipulate the other white, unshaded counties, and that's what we're going to be doing with the other map options?

MS. CHURCHILL: Mr. Chair?

CHAIRMAN HALL: Lady is recognized to respond.

MS. CHURCHILL: Yes, Representative Harrison. With the crosshatched districts in the Duke House fixed, that would establish the groupings for 107 of the 120 districts. Of that 107, 11 -- or of the 33 clusters, 11 of those clusters would be single-member districts. The remainder would still need to be divided into single-member districts. So the counties in white that have no shading, no crosshatching, would be the options to combine together to create the remaining 13 House districts.

CHAIRMAN HALL: And members, and for those folks listening at home, the chair has often referred to these maps as groupings, and you hear Ms. Churchill refer to them as clusters, and those are synonymous terms, just for those listening, to

make sure everybody understands. If you've been through this before, you know that. But if you're new to this committee, or you're listening online and haven't watched this committee before, that may be confusing.

But is that your understanding, Ms. Churchill?

MS. CHURCHILL: Yes, sir. There's actually three terms that I've heard for it. There's the clustering, which is the phrase that the group from Duke used in their paper, which is what I was reading from. There's also groupings, which is kind of in the court orders, as well as clustering. The other phrase I've heard used to describe this is podding, or creating a pod. I believe all three to be completely interchangeable.

CHAIRMAN HALL: That's right. That's the chair's understanding as well.

Representative Harrison.

REPRESENTATIVE HARRISON: Mr. Chair, if we have questions about the clusters and the process, should we ask them now of you and the committee, or do you want her to talk about the technical and then have the questions after that?

CHAIRMAN HALL: At this point, if you've

got a question for the chair, let's just wait. This is just questions for right now to Ms. Churchill. She's not going to leave after this. She'll be right up here, so if we have another question for her later. But while they're there at the podium, the chair thinks it's appropriate to give members the opportunity to ask them questions.

Representative Warren.

REPRESENTATIVE WARREN: I've got a question for Ms. Churchill.

I'm sorry, when you look at the white clusters, and the different iterations of them on the following maps, I noticed that the numbers stay the same within those configurations. So is this just a matter of looking at those particular counties in terms of their connection to each other, continuity of it, or the contiguousness of it, or whatever the word is we're looking for there?

MS. CHURCHILL: So, Mr. Chair, if I might?

CHAIRMAN HALL: Lady may answer.

MS. CHURCHILL: So you are absolutely correct. So starting kind of in that western corner, the counties of Surry, Alleghany, Ashe, Watauga, Wilkes, Caldwell, and Alexander, that white area has a population in it sufficient to support

four single-member districts. So it becomes a question of how to group those counties together to best create districts that are in compliance with Stephenson. And there are two options there. Both would be two-member districts. It's just a matter of what the committee chose to use.

REPRESENTATIVE WARREN: And follow-up?

CHAIRMAN HALL: The gentleman is recognized.

REPRESENTATIVE WARREN: So, Ms. Churchill, one of the things I noticed in the hearings I attended was some folks in the general public not having an understanding that we try to do these in terms of, not breaking down counties or municipalities, but to stay within the mandates of the population, and you're staying within this cluster. That, in some cases, creates a situation where you have no choice but to comply with the district's population; is that correct?

CHAIRMAN HALL: The lady is recognized.

MS. CHURCHILL: I will attempt that one. And I'm going to pick on the chair for just a moment. His home county of Caldwell --

CHAIRMAN HALL: Join the club.

MS. CHURCHILL: -- as an example.

According to the federal decennial census, it's 80,652 people, which is outside that ideal range of 82,645 to 91,345 for a single-member district. So it would need to be combined with some other contiguous county to create a single-member district. Or it would need to be divided with some other contiguous counties to create two single-member districts. That would be up to the committee how they wanted to do that.

REPRESENTATIVE WARREN: Thank you very much.

CHAIRMAN HALL: Further questions or any comments for legislative staff?

Representative Dixon.

REPRESENTATIVE DIXON: Thank you, Mr. Chair.

Ms. Churchill, without having to add them up, how many House seats are there in the white area including Duplin and then this white area with Tyrrell?

MS. CHURCHILL: So --

Mr. Chair?

The area --

CHAIRMAN HALL: The lady is recognized.

MS. CHURCHILL: -- including Duplin, Wayne,

Sampson, Bladen, Pender, and Onslow is population sufficient to support six single-member House districts. That northeastern corner beginning at Pamlico, running all the way up to Currituck and over to Hertford, is population sufficient to support three single-member districts.

REPRESENTATIVE DIXON: Thank you.

CHAIRMAN HALL: Further discussion or any questions for legislative staff?

Okay. Ms. Churchill, if you want to give us an example of how to use these terminals, the lady is recognized to do that.

MS. CHURCHILL: I'm going to ask Will. He's going to come up and help me.

CHAIRMAN HALL: Along with -- yeah, absolutely.

MS. CHURCHILL: So I would note a couple of things, as Will is getting us started. Each one of these terminals will be directly fed to a livestream. An audio from that terminal will be fed to the livestream. There will not be a video associated with that terminal. There will be a video of the room that will be seen by the public. The public here in the room can choose to use the screens here, or they can choose to use the North

Carolina General Assembly Wi-Fi to log on, if they wanted to focus on just one of the four terminals.

And I'm going to walk over to the terminal, so we can turn that on, so you'll see what it's going to look like. So from here, you will be able to see a House plan. And so, these are just examples that we have been testing to make sure that everything works. These are existing plans; they are nothing new. We just wanted to make sure that everyone had a map that could be seen, can be used; the software works.

So this is what you would see on the screen in the room. We will leave this up and going until after the committee adjourns, so that someone can walk around and see what an actual drawing station would look like as you were sitting at it to engage with the staff to instruct us how to draw a map of your choosing.

CHAIRMAN HALL: And, Ms. Churchill, if you will describe what's the large TV to your right for?

MS. CHURCHILL: They are identical. So a staff member will be sitting at the smaller screen. Member, or whoever -- whatever group of members are together, will have the larger screen available to them to stand behind, to sit behind, just so that

it's a little larger, a little easier to see.

CHAIRMAN HALL: Members, do we have any questions for -- questions or debate about how the process will work in terms of what Ms. Churchill has just described? Again, I'm going to stand for some questions.

Representative Torbett.

REPRESENTATIVE TORBETT: Just for reference, it's my understanding -- I think she eluded to it -- the staffer is there to actually to the map drawing with assistance and information from the member; is that how that's going to work? Because some of us in here have never done map drawing.

CHAIRMAN HALL: The staff folks are there because they understand how to use the software, but it will be completely up to the member to direct the staff member as to how to draw those maps. And staff will -- it wouldn't be appropriate, of course, for staff to make decisions about how to draw. But to answer your question, yeah. You're absolutely right. It will be up to the member to tell the staff member, who knows how to use the technology, how to draw.

Representative Carney.

REPRESENTATIVE CARNEY: So I'm not sure if this question is for now or later, but. So if I come in as a member and I'm drawing on a map, and I leave the room, somebody else comes in, draws another map, and then I want to make an amendment, how does that work?

CHAIRMAN HALL: The chair is going to initially respond to that and let Ms. Churchill respond to sort of the mechanics of how that works. But, in the past, what has happened is, if you go in and draw a map, and let's say you want to take a break and go eat lunch, or whatever it is you want to do, you can save your map in the system, so that somebody doesn't come behind you and start drawing on the map that you've already created. So you'll be able to save that. You'll be able to come back later on and draw that map.

Now, Ms. Churchill, is that correct, in terms of technology?

And I'm going to continue on with that to try to answer what I think your whole question is, but yeah.

REPRESENTATIVE CARNEY: Okay.

MS. CHURCHILL: So, yes, sir. Unlike with our drafting system where you were used to us being

able to get to any prior iteration that we have drafted for you, the mapping software doesn't work quite like that. But we are set up internally to make sure that the map that you closed out before you stepped away to get a bite to eat or go to a committee meeting is always there.

When you come back, we will be copying that map to pick up exactly where you left off, so that we will always have that first map, just in case something goes wrong, and you just need to go back to it. So there will be an option for you to pick up wherever you left off and continue going from there. There will be an option for you, if you really like what you -- hated what you did in that second session, you can go back to the first session and pick up again and start over.

CHAIRMAN HALL: And to answer your question about how to, perhaps, change a member that another member's drawn -- and I guess the real question is amendments -- there will be an opportunity for members of the committee to put forth amendments on whatever map or maps this committee ultimately takes up.

And the chair anticipates, as we've done in the past, members can decide whether they want to

put forth a whole map of the state as an amendment, or whether they're just wanting to amend certain groups or I guess even certain districts. Members will be given an opportunity to put those forth.

REPRESENTATIVE CARNEY: So just a follow-up.

CHAIRMAN HALL: Yes. Lady is recognized.

REPRESENTATIVE CARNEY: And I have never drawn these maps before, so that's why I have all these questions. So these amendments would come -- our amendments would come after we have a map?

CHAIRMAN HALL: Yeah. So if the lady will think about it just like a normal committee meeting, where a bill is before the committee --

REPRESENTATIVE CARNEY: Right.

CHAIRMAN HALL: -- and members are putting forth their own amendments, or perhaps they're wanting their own bills to be put forth at a given time. Really, the easier way to think of it is, members are wanting to put forth their amendments to the bill that's on the floor. The opportunity to do that will be there.

If, let's just say that you like the map that's before the committee, but for a couple of the groupings, and you know, rather -- if you just want

to focus your argument, or whatever the case may be, on those two groupings, the lady can say, look, here are the two groupings. I'm just putting those forth as an amendment. I'm okay with the rest of the map. The opportunity to do that will be given.

REPRESENTATIVE CARNEY: Thank you very much.

CHAIRMAN HALL: And let me say with that, obviously, we're under a tight time constraint. And so we don't have time for the committee to consider 100 maps from every member, you know, who's on there. So at some point, the chair will have to limit that. But as of now, the chair doesn't anticipate having to limit members amendments or proposed maps. Chair thinks that we'll be able to do that in a time efficient way, and still get our work done in time for filing.

Other questions or debate again for legislative staff?

REPRESENTATIVE RICHARDSON: Mr. Chairman?

CHAIRMAN HALL: Representative Richardson.

REPRESENTATIVE RICHARDSON: If I might. Would it be the best practice if when we're drawing -- if we're doing a map, that we articulate our reasonings? Like the criteria that we have listed

and adopted, like communities of interest, should we -- if we do an amendment, or do part of a map, or do part of a district, should we state the reasoning on there that it follows the criteria and which criteria it follows or just not comment? Or what are we -- give us some guidance on that.

CHAIRMAN HALL: You know, that's really up to each individual member as to what they want to say while they're drawing the map. And if a member wants to say, "Here's why I'm doing this," every member is free to do that. This committee has adopted a set of criteria that's to be used in drawing the maps, and so that will be the member's choice whether they think that is a best practice or not a best practice.

Further questions or debate?

Representative Carney.

REPRESENTATIVE CARNEY: Thank you, Mr. Chairman. So if -- did I hear you or Erika say that the public is going to have access to all these portals; is that correct?

CHAIRMAN HALL: So --

REPRESENTATIVE CARNEY: As we are drawing.

CHAIRMAN HALL: -- I'll let --

Ms. Churchill, go ahead and answer that,

and I may weigh in.

MS. CHURCHILL: Okay.

So, Representative Carney, as this is set up currently, a member of the public can choose to look at what is happening at station one online. A member of the public could choose to come to the room and sit in the back and could see all four stations going simultaneously. But to the best of our knowledge, the public will not be standing behind a station, over your back, over staff's back, instructing, conversating, that kind of thing.

REPRESENTATIVE CARNEY: Okay. Just a follow-up.

CHAIRMAN HALL: The lady is recognized.

REPRESENTATIVE CARNEY: So will that -- each time a member comes and draws a map, is that archived for the public?

CHAIRMAN HALL: So the chair's understanding is that any map that's drawn by a member of this committee in this committee room becomes a public record.

Ms. Churchill, will you speak to that?

MS. CHURCHILL: Yes, sir.

Our understanding, as well, because this map is being drawn in public before the committee,

it is a public record. We will have a copy of it. It will be saved forevermore. At this time, we have not been instructed to place any of those maps online. If the committee so instructs, we will be happy to do that.

REPRESENTATIVE CARNEY: So that -- may I just comment why I'm asking that question?

CHAIRMAN HALL: The lady is recognized.

REPRESENTATIVE CARNEY: Is through the public hearings, I was -- attended a lot of those, and that was one of the questions that kept coming up over and over again is, will the public have an opportunity to be a part of drawing these maps, or seeing, actually having access to the drawing of these maps, publicly. That was why I was going that way.

CHAIRMAN HALL: Representative Cooper-Suggs.

REPRESENTATIVE COOPER-SUGGS: Thank you, Mr. Chair.

And thank you, Erika.

Still on that same vein, in talking about the public, and the maps that we're going to see, we know that the public has had that keen interest, by attending the sessions, as well as the feedback that

they have given. So what steps are you proposing to assure that the public be involved in these maps that represent them?

CHAIRMAN HALL: And if the lady will indulge me to wait just a minute, until I can let Ms. Churchill sit down. Because the chair is going to take questions like that one, for example.

If there are any other questions for Ms. Churchill --

And I will come back to you, Representative Cooper-Suggs.

REPRESENTATIVE COOPER-SUGGS: Thank you so much.

CHAIRMAN HALL: Representative Torbett.

REPRESENTATIVE TORBETT: Thank you. I was going hope I think this one fits in this segment. Is there intent -- should we have an anomaly or a glitch in the technology, do we think the mapping should suspend until such time that that glitch will reconnect or --

CHAIRMAN HALL: We'll deal with that if and when it happens at the time. Let's hope it doesn't.

Representative Brockman.

REPRESENTATIVE BROCKMAN: I'm not really sure if this question was answered, but

Representative Carney asked if members of the public would know who was drawing maps at the specific time. Will they know, say, for example, Representative Brockman is working on a map at this time; will they know that?

CHAIRMAN HALL: Ms. Churchill?

MS. CHURCHILL: At this time, the way it is set up, no, sir. They will know that -- they will be able to see what is being drawn on station one. From the audio, they would be able to hear your voice, your instructions, but there would not be a label that was there at all times to say that this is Representative Brockman speaking. We can try to work on something of that nature, if the committee would like.

CHAIRMAN HALL: The gentlemen is recognized.

REPRESENTATIVE BROCKMAN: But there would be something that says, at the end of the day, that this is Representative Brockman's map; is that correct?

CHAIRMAN HALL: Yes. So the chair will speak to that. There will be something on the final map that says who has drawn that map, at least the original part of it. It may be amended, but the

amendment will have the member's name on that. And we've done that in the past.

Ms. Churchill.

MS. CHURCHILL: And I might kind of step in just a little bit to remind everyone that the maps are not what the General Assembly enacts. It is the bill that is sponsored by a bill sponsor, just like every other bill in the institution. The amendments the same way. For an amendment offered by Representative Brockman, the amendment will state that it was offered by Representative Brockman. It will have attached with it a visual of the map, but it is still technically the amendment that the General Assembly is voting on. So yes, sir. All of that will come together.

CHAIRMAN HALL: Okay, members. Are there any questions that are just for Ms. Churchill, at this point? I know another one may arise, so she's not leaving.

Okay. If not, Ms. Churchill, thank you very much for your eloquent presentation.

Members, the chair is going to hand the gavel over to Representative Saine and stand for questions.

VICE CHAIR SAINE: All right,

Representative Hall. Are you ready?

CHAIRMAN HALL: I am. And, Mr. Chairman, if you will start with Representative Cooper-Suggs. She had a question that was appropriate for the chair, but I wanted to wait until I got over here to answer it.

VICE CHAIR SAINE: The chair would be happy to do that.

Representative Cooper-Suggs.

REPRESENTATIVE COOPER-SUGGS: I can wait. I can hold off for a moment. If that's all right.

CHAIRMAN HALL: Okay. Fair enough.

VICE CHAIR SAINE: Fair enough. Thank you, Representative Cooper-Suggs.

Representative Richardson, I think I've got you, and then maybe Representative Harrison.

REPRESENTATIVE RICHARDSON: Mr. Chairman, thank you for taking these questions. When we went to these public hearings, I heard over, and over, and over again several things, you know, communities of interest, you know, and the like. But one thing I heard repeatedly was -- is that the public wanted input after we came up with maps, before we voted on them. I know we're on a tight budget, a tight schedule, you know, with this, and it's going to be

tough. But is it your plan to have some public hearings after -- before we vote on the final maps, but while the maps are up for consideration?

CHAIRMAN HALL: Thank you, Representative Richardson. So what I will say is that I do anticipate there being some manner of public hearing on whatever the final proposed version of the map is, before the House approves that. And we've done that in the past.

But, you know, I want to speak to what I think is often missed sort of in the story about when or how we're going to do public comment this time around. And that is, the way that we're doing this, the way this committee, as well as the Senate committee, has decided to do this process is simply unprecedented.

The folks on this committee could decide as a committee that we're not going to do this out in the open. The law would allow committee members, we could just simply have somebody draw these maps behind closed doors, as has been done in the past. The law would allow the use of election data to be used in these maps, and there's no binding precedent, whatsoever, that prevents this committee from using election data in drawing those maps and

preventing the committee from doing it behind closed doors.

We are voluntarily saying we don't think that's the best way to do this. We think the best way to do this is in this committee room, with these screens, the technology to allow members of the public to watch what's going on, to listen to what we're saying as we're drawing these maps, to literally, in real time, watch us draw these maps. That has never been done before in a voluntary manner.

In 2019, you were here, Representative Richardson, and many members of this committee were here, we did that in some fashion because we were court ordered to. Gentleman's a lawyer, I think he'll agree, there's no binding precedent from that decision, and this committee would be free to go right back to having some consultant draw these behind closed doors, put them on the floor here, and vote on them. But we're choosing not to do that.

We're taking the unprecedented step of being as transparent as I believe we possibly can with the way that we're doing this committee process. Obviously, you know, things can always be done better. We want to do that, if we can. But

the unprecedented amount of transparency should not be lost, not only on the members of this committee, but the members of the public, as they watch us do our business.

REPRESENTATIVE RICHARDSON: Thank you.

VICE CHAIR SAINE: Thank you.

Representative Harrison.

REPRESENTATIVE HARRISON: Thank you, Mr. Chair.

Thank you, Chair Hall. Looking at -- looking at Doctors Carter, Mattingly, et al.'s article -- and Erika Churchill mentioned this -- they say they want -- that's the one part of the Stephenson v. Bartlett decision this analysis does not reflect its compliance with is the Voting Rights Act.

So I sort of skimmed Stephenson v. Bartlett, in anticipation of this meeting, and I'm just wondering, because that seems a very important point of the Stephenson decision is compliance with the Voting Rights Act. So how -- so we're starting with maps that don't take that into account at all, and I'm just wondering how we're complying with that?

CHAIRMAN HALL: Thank you for the question,

Representative Harrison. As the lady knows, this committee has made a decision to not use race at all in the drawing of our maps. I'll also note that, as you know, there's been a lot of litigation in this state over the redistricting process in general. We've had many, many lawsuits going back to when Democrats were in the majority and since Republicans have been the majority. It's really been no different. We've had many, many lawsuits.

What we've seen in those lawsuits, at least in the last few lawsuits that we've seen, is the plaintiffs in those suits that were trying to set aside those maps have said that there is no legally significant racially polarized voting in North Carolina. That's the plaintiffs and their own experts who are saying that.

We've drawn maps in both 2017 and 2019, not using racial data at all. And those maps have been approved -- groupings, rather -- the lady's question is specifically as to groupings, and I'm sort of answering the grouping and map question in one. But we've used groupings in 2017 and in 2019, not taking into account any sort of racial data at all. And courts have uniformly upheld those groupings that we've used, without using racial data.

So we are going to stick with the criteria of the committee and not consider any racial data at all. And based on the past precedent of doing this, we're confident that that will comply with the Voting Rights Act.

REPRESENTATIVE HARRISON: Follow up?

VICE CHAIR SAINE: You're recognized.

REPRESENTATIVE HARRISON: I appreciate that very thoughtful answer. I actually meant with regard actually to the whole mapping process, so you anticipated my question. But I'm looking at section two, that provides to states that "political subdivisions can't impose any voting qualification or prerequisite that impairs or dilutes, on account of race or color, a citizen's opportunity to participate in the political process to elect the representative of his or her choice."

So how do we know -- if we don't take into account race, how do we know that we're complying with the Voting Rights Act? And I kind of understood you to say that we're relying on past, but I'm just -- can you respond to that, please?

CHAIRMAN HALL: And that's the way -- the way we know is because we've already done it. We've done it before and courts have upheld the drawings

of these maps, the groupings and the districts themselves, without this committee using any racial data at all. We've done that twice now, so I'm confident that, without using racial data, we will comply with the Voting Rights Act.

REPRESENTATIVE HARRISON: One more follow-up, I think.

VICE CHAIR SAINE: You're recognized for follow-up.

REPRESENTATIVE HARRISON: Thank you.

And I guess a lot of my questions have to do with compliance with the Voting Rights Act, and I think I understand your answer is going to be the same, so I'll move to the Common Cause decision that you referenced earlier. And I appreciate the committee's commitment to transparency.

You did say it's an non-binding precedent, so you all don't anticipate -- do you anticipate using any of the ruling from the holding from that decision to guide this process? Do you all feel bound by any of that decision in terms of following the process that the court ordered?

CHAIRMAN HALL: From a strictly legal stance, it's not a binding precedent that anyone is required to follow. But as the lady knows, based on

the criteria the committee has adopted, that is something that this committee has to follow. And we've taken a lot of language out of that opinion and put it into this committee's criteria.

The computers that you see here and the online audio and video, none of that is binding. We are voluntarily doing that. You know, frankly, we learned from that case that perhaps a better process is one that is just like we're doing -- like we did then, like we're doing now, as an open and transparent process. So, you know, while it may not be binding, the committee has chosen to impose upon itself some of the principle outlined in the Common Cause case.

REPRESENTATIVE HARRISON: I think I'm going stop for now and let somebody else ask questions. I might have more. Thank you.

VICE CHAIR SAINE: Thank you, Representative Harrison.

I have Representative Cooper-Suggs and then Representative Hawkins.

Representative Cooper-Suggs, you're recognized.

REPRESENTATIVE COOPER-SUGGS: Thank you so much, Mr. Chair, and Representative Hall. Thank you

so much.

My question was -- it goes back to the public's input and that the keen interest that they've had in this process, and we've seen that, you know, as I stated earlier, through the districting process as well as through the online portals too. Over 3000 people have responded, so we know that there's interest out there.

And so my question deals with, what steps are you proposing to assure that the public be involved in the efforts to create maps that represent them?

CHAIRMAN HALL: Thank you, Representative Cooper-Suggs, for the question. So I'll go back to what I said previously in response to, you know, what efforts are we making to make sure those folks can follow this process to make sure that it's doing whatever they feel like it should do. Because some of members of the public feel one way about what this process should ultimately end up with, and others feel in different ways. They're differing opinions.

Again, I think it's important to understand context of what's happened in the past, in this building, for the past 200 years when this body has

drawn maps. What has happened in the past is some outside entity, a consultant, goes and they draw the map behind closed doors. We would come into this committee, just like we're in right now, and throw a map down in front of the committee members and say, "Here's the map that we propose."

We're not doing that this time. What we're going to do this time is a more open and deliberative process for this committee. We will literally be drawing on the stations that you see, so members of the public across the state and, in fact, across the world, can log onto the website and watch these maps as we draw them in live fashion.

And then, we've seen that the public comment portal is actually much more popular than the in-person public comment method, for one reason or the other. We get many more comments through that portal. We get many more emails, as members of this committee can attest. You receive emails all the time from folks and, you know, probably messages in many different ways and phone calls.

So the public has favored that online portal in telling us how they want to see this done. That portal is going to stay open throughout this process, so an individual sitting anywhere in our

state, and again, anywhere in the world, can sit and watch what's happening. Can literally send a comment right then, simultaneous with that drawing going on and say, "I'm watching station four. I don't like what I see in X district," or "I do like what I see in X district."

That's going to be time-stamped. The committee members are going to have a chance to read every one of those. And so, there is ample opportunity for members of the public to weigh in on these maps. Again, in the past, there's been little opportunity because the maps are already drawn. Folks can come in here and talk all they want, but the map has been drawn.

That's not the case here. We had public comment ahead of time. We're going to draw these in public. And I do anticipate at least some in-person public comment moving forward. With all of that said, I do anticipate at least some form of in-person public comment at the end of this.

REPRESENTATIVE COOPER-SUGGS: Follow-up question.

VICE CHAIR SAINE: You're recognized for a follow-up.

REPRESENTATIVE COOPER-SUGGS: I just want

to make sure I fully understand this. So how are we going to use the comments -- the public comments when drawing these maps? Their actual comments, how are we going to use those?

CHAIRMAN HALL: So that's up to each member of this committee to decide what they want to discern from a given comment. We know that if you read all of these comments, there are some of them that you can't do what both of them say. So you can pick out two messages, and one person wants you to do one thing; and the other person wants you to do something else. So what do you do? Well, that's the decision for each member of this committee to make, what they want to do in response to that public comment. What I can tell you this committee has done in response to that is to ensure that we have the most transparent process in the history of this state.

REPRESENTATIVE COOPER-SUGGS: Thank you so much.

VICE CHAIR SAINE: Thank you.

Representative Hawkins.

REPRESENTATIVE HAWKINS: Thank you, Mr. Chairman.

Thank you, Chairman Hall. I really

appreciate you taking the time, and not only to sort of travel across the state for these public hearings, but to take these questions.

And so, one of the things that you mentioned that I want to follow up on is you said, "throughout this process." Meaning that the public comment portal will be opening throughout this -- can you define what that is? Because I know I've actually received that question on our start and ending time, so that people know how to engage it fully, and sort of when their last time is to do so.

CHAIRMAN HALL: I anticipate that public comment portal being open until at least the time that this body adopts -- meaning the House and the Senate, the General Assembly, at least until the time the General Assembly adopts state House maps, state Senate maps, and congressional maps. That public comment portal will stay open until at least that time.

REPRESENTATIVE HAWKINS: Follow-up.

VICE CHAIR SAINE: You're recognized for a follow-up.

REPRESENTATIVE HAWKINS: Thank you, Mr. Chairman.

So a follow-up question is around I think,

you know, earlier, yourself or Erika Churchill mentioned hearings. And so, of course that's probably the most popular question is if we're going to have hearings after this. And you said that that would be up to this body.

Can you give us a time line in the way you see this and when we would kind of make that decision? And when you think that this body should, you know, between now and when we actually have to file, when we need to do that? Because I think, again, a lot of folks would want to know if we're going to sort of go back out on the road and talk about these again.

CHAIRMAN HALL: You know, I'll answer that by saying, you know, as the gentleman knows, we're on an extremely truncated time line, and that's nobody's fault in this body, on either side of the aisle. We just simply didn't get the data in time to do this in the way that it's been done in the past. And especially when you couple it with the fact that the maps aren't being drawn by a consultant somewhere and being delivered here, and us going and voting on them. We're going to do that.

We're going to take the time to draw these

in this committee, out in the open, and that takes time. As the gentleman knows, you know, we've drawn these maps together in years past. We haven't done it this year, for everybody listening at home. He and I, in the past, we've worked together on drawing maps in prior sessions.

So it's difficult to say and commit to some form of public comment afterwards because the reality is we've got to get these done in time for the state board of elections to get ballots finalized. I don't know, frankly, how long it's going to take us to draw these maps. I expect to hopefully start to get some gauge as we get in this thing tomorrow, but for all I know, you know, it may be the last week of October and we're still in this room trying to finalize one version of these maps.

And they really need to all be done in the sense that we need to have some final map in place before that public comment comes in, so that they can comment on whatever it is that we're considering.

Again, I will say that I do anticipate at least some form of in-person public comment. I just don't know the method, where it will be at, and how much it will be, because of our truncated time line.

But I will just again say, the online version has been extremely popular. We've had a lot more comments there than we've had at some of the in-person sites, where we didn't have a ton of people show up. Some sites, we did have a lot, and others, not so much.

So, you know, folks across the state still have the ability to directly communicate with us and they've got the chance to watch this happen live. So, you know, I am satisfied that the public's got ample opportunity to weigh in on what we're doing in.

REPRESENTATIVE HAWKINS: Thank you.

One last follow-up, Mr. Chairman.

REPRESENTATIVE SAINE: You're recognized for a follow-up.

REPRESENTATIVE HAWKINS: Again, to be clear, in 2019, when we worked on this project together on behalf of the citizens of North Carolina, we both had -- and everyone did -- had a keen interest in groupings because we understand that the way that counties are grouped directly relates to how districts are potentially drawn.

And so one thing that came up last time, but I think we can sort of potentially get ahead of

it this time, is how, you know -- how the committee will approve the entire map. Or is it possible for us to go and approve grouping by grouping, once we go through this process?

Because I think, again, if you remember, a division of the vote in the 2019 session, that would have given us the ability to isolate and really draw down on each individual grouping, which I think could be really helpful. But I wanted to see what the chairman thought about that ability for us to do that this go round, sort of understanding how we did operate in 2019.

CHAIRMAN HALL: You know, I anticipate, as I said earlier, taking up member's amendments that they have, in whatever format that they want to put forth, whether that be an entirely new map or a specific grouping, with the only caveat of saying we can't take up -- every member of this committee can't up with 50 or 100 amendments and us possibly have time to get this done.

So assuming that doesn't take place -- which it hasn't in the past, and so I don't anticipate that being the case this time around -- I think it will be similar to what we saw last time, and that is, you know, members can put the amendment

in whatever form they really saw fit.

REPRESENTATIVE HAWKINS: I keep saying one last follow-up, Mr. Chairman.

VICE CHAIR SAINE: Well we'll give you one last follow-up.

REPRESENTATIVE HAWKINS: And so, you know, I, like you, native North Carolinian, and my birthday is in May, so I was always used to having a May primary. And I understood, you know, why we moved it to March, to play in the presidential. But this is a mid-term, and so, is there any appetite, potentially, to move the primary back to May, in the mid-term, versus the way we do it in presidential years? To give us the ample amount of time to work on these maps and have the potential public comment and have the fun that we did last go round on this project.

CHAIRMAN HALL: You know, I'll answer that question by saying you know, I haven't seen that appetite from the body. You know, I chair redistricting and rules and I will leave it at that. You know, I don't anticipate us moving that deadline back, I think for a number of reasons.

But one of the best reasons, I think, is folks have planned for that for some time now, and I

certainly understand the gentleman's argument that perhaps it gives us more time to get it done. But on the same token, you've got folks who have been running for maybe statewide offices, and you've got folks who have planned to run at given times, and so, at this point in the game, I anticipate keeping our filing deadlines as is.

REPRESENTATIVE HAWKINS: Sure. Well I would just argue, Mr. Chairman, that it gives those people -- North Carolina has ten and a half million people, and it's a pretty big state, so that would give those statewide folks a lot of time to know the people of North Carolina. But I really appreciate your time, Mr. Chairman. And thank you for the ability to ask questions.

CHAIRMAN HALL: Thank you, sir.

VICE CHAIR SAINE: Thank you.

Any other questions?

Representative Harrison, and then Representative Carney.

REPRESENTATIVE HARRISON: Thank you, Mr. Chair.

And Chair Hall, when you were talking about us being bound by the criteria of not using race or partisan data, so any individual can -- any member

of the House can draw a district, will they be bound by the same criteria?

CHAIRMAN HALL: Yes. So to be clear, only a map that's drawn in this room is going to be considered by this committee. And on these computers in this room, you essentially are bound by that criteria because there is no racial data or election data that's loaded into these computers.

But to answer your question, yes. Everybody will be bound by the same criteria. It's not that a member that's not on the committee can go draw whatever map they want to and sort of get around our rules because they're not on the committee. They must follow the criteria.

REPRESENTATIVE HARRISON: For a follow-up?

VICE CHAIR SAINE: You're recognized for follow-up.

REPRESENTATIVE HARRISON: But it seems like if you come in, and you might have the material with you, it might not be actually loaded in the software, but you might actually have -- I just didn't know if there was some way to enforce that, or how do you plan to do that?

CHAIRMAN HALL: Well, you know, I don't plan to search every member who comes into this

committee room, nor do I want to do that. I don't want to know what some of you all have in there. But, you know, it's one of those things where, at the end of the day, the members of this committee are elected representatives. You're elected by your constituents to come up here and do a job. And, you know, I'm not going to -- I always try not to question people's motives when they do something, and I think this falls in that same vein.

So, you know, members can -- are free to handle those issues as they see fit, but they will follow the criteria in the sense that that data is not in these computers. But I'm not going to -- I'm not going to search their bags when they walk in.

VICE CHAIR SAINE: Recognized for a follow-up.

REPRESENTATIVE HARRISON: Thank you. Appreciate that.

And I think in 2019 we had a portal open for the public to draw maps. Are we planning on doing that this time around?

CHAIRMAN HALL: We are.

And if the chair will recognize Ms. Churchill to speak to that.

MS. CHURCHILL: Yes, ma'am. Representative

Harrison, there will be two public terminals available for use starting tomorrow morning at 9:00 a.m. The public will be asked to schedule in advance, so that they can assure that a terminal is there during the time that they want to use it. They will be asked to bring a thumb drive, or other device where they can save their work, because the terminal will be reduced back to its original state when they leave.

REPRESENTATIVE HARRISON: I appreciate that.

I think I have two more questions, and they're quick, hopefully. I don't want to belabor the point, but in the last meeting we had on August 18th, several of us had gotten together and advocates had proposed a public participation process and a transparency process.

We also all received a letter from Caroline Fry, on Friday, that came from a large group of advocates asking for procedures to be followed by this committee. One of those is transparency related to third-party participation, disclosure of that. Is there any plan to the extent that folks are consulting with counsel or data people, or -- is there any plan for disclosure of that sort of issue?

CHAIRMAN HALL: You know, in the same vein of -- as chair of this committee, I'm not going to make it a practice to search people's folders or their bags when they come into this room. I'm also not going to inquire into everybody that they're talking to one way or the other. Again, we're all elected here. You've got a duty to your constituents, and you've got the decision to make as to how you want to carry out that duty. But I, as the chair of this committee, I'm not going to police who folks are talking to.

REPRESENTATIVE HARRISON: I appreciate that. And just last follow-up. I don't think I was asking about policing, but just disclosure. And I think that was what the public was asking for. Thank you.

VICE CHAIR SAINE: Thank you.

I've got Representative Carney and then Representative Hawkins.

Representative Carney.

REPRESENTATIVE CARNEY: Thank you, Mr. Chairman, and Representative Saine.

And Mr. Chairman, thank you for taking all of our questions this afternoon. I want to go back to the drawing of these maps in this room. And I

guess I am one that envisioned, at first, that this committee would come in here for two weeks, gathered around the maps, work together in a non-partisan way to draw these maps out in the public, as you've stated. But I'm hearing now, and I'm understanding, member -- when you said any member can come in here from 9:00 to 5:00 Monday through Friday for two weeks -- correct me if I'm wrong.

CHAIRMAN HALL: That's right.

REPRESENTATIVE CARNEY: But any member of the legislature. House members in here, and I guess the Senate will be doing the same. So it is going to be beyond -- the map drawing will go beyond just the committee members; is that correct?

CHAIRMAN HALL: Yes. And one thing I do what to correct that you said. You said Monday through Friday for two weeks. I don't know if it's going to be two weeks or not. I don't know how long it's going to take. But -- and I understand why the lady is asking the question.

And, you know, having done this in a similar fashion in 2019, what ends up happening when you leave this committee room open for that long, it gives members an opportunity to come in and draw as they see fit. Just as you and I have the right as

House members to draft -- to have drafted whatever bill we want to have drafted.

The reason that we're doing it that way is, you know, we wouldn't tell members, prior to the filing or bill drafting deadline, we wouldn't say, you know, only certain members can file bills. You know, sometimes that may be preferable for our given caucuses, but unfortunately, maybe unconstitutional.

So, in the same vein, I want to give every member of the House an opportunity to be able to draft their bill, so to speak, if they want to do that. But you also see happening, especially sort of in peak hours, so to speak -- so, you know, in the mornings I would anticipate on like Tuesday, Wednesday, Thursday, you're going to have several people in here. And Representative Hawkins and I have done this in the past. Some of those parts of the maps that we're under right now, he and I literally drew together in this committee room. I mean, substantial parts of them. We didn't have to agree on every single thing, but substantial parts of them, you know, we sat down and drew them together.

So some of that will happen. You know, members may ask members from given districts to come

over and say, "Hey, what do you think about, you know, this given area? You know it better than I do." So that's going to be allowed, I mean, that teamwork, so to speak. But the reason for leaving it open so much is just to give members the opportunity to have their voice heard, so to speak, in this committee room.

REPRESENTATIVE CARNEY: So a follow-up?

VICE CHAIR SAINE: You're recognized.

REPRESENTATIVE CARNEY: If there are 120 members out of 120 -- let's say every member decided to come in and put something in to these maps, a little section, or their own, or whatever, their own districts, how do we pull all of that together? And I know staff will be the ones that will pull that so that it meets all of the criteria, and pass all the must, or whatever. Will we come up with one map, or two, or three maps that then the committee would vote on? I'm just asking.

CHAIRMAN HALL: I think we'll have multiple maps that the committee will vote on. You know, just like with any other committee, if you're not a member of this committee, if you want to draw a map, you're going to need to get a member of this committee to present that for you. Just like on any

other committee, if you've got a bill that, if you can't be in a given committee, or you're not on it, you just want somebody on it to present, they need to present it for you.

That's probably -- and actually, now that I say that, it depends on the timing. Let me actually take that back. Because if we have time, you know, to let other members come in and speak to that, just like we would other committees, we'll do that. But I do anticipate that sort of creating a time crunch for us. And so most likely what we're going to do is limit it to the members of this committee presenting amendments and presenting their various maps.

REPRESENTATIVE CARNEY: And one final. How will this be -- how will we let the other members know -- and of the course the public that is listening -- how will be let them know about this process? Is there going to be an email sent out to everyone that they will understand what we're doing?

CHAIRMAN HALL: We will probably send something out just to say, you know, if you want to come in and draw, that you can. But I think that, you know, the rules are fairly simple. Once you get in here you see, you know, you can go to the station

and draw as you see fit. But we will make it known that all House members have the ability to come in here and draw maps during the committee period.

REPRESENTATIVE CARNEY: Thank you.

REPRESENTATIVE SAINE: Thank you.

Representative Hawkins.

REPRESENTATIVE HAWKINS: Yes, sir. Thank you, so much, for the second opportunity to ask questions about redistricting. The first question is around the ability for multiple language speakers to use this portal and have their languages translated properly.

Representative Torbett and I were in Durham, and he was so kind to allow for a translator, a Spanish speaking translator, for our Spanish speaking population to take part. And maybe this is a question for staff, since we potentially may not have in-person public hearings in the future, how are multiple languages being transferred into the English language, so that we can decipher it and make sure that they have a part in the process?

VICE CHAIR SAINE: Ms. Churchill.

MS. CHURCHILL: Representative Hawkins, I'm not going to commit to anything, because I'm not

sure what we can do with the technology, but we are absolutely happy to look into what our options are, and report that back to the chair.

REPRESENTATIVE HAWKINS: Okay. I also heard you were Erika Churchill, and you can do all things, but just putting that out there.

MS. CHURCHILL: Speaking French is not one of those things.

REPRESENTATIVE HAWKINS: Okay. 10-4. Just --

CHAIRMAN HALL: I believe she said not yet.

REPRESENTATIVE HAWKINS: Follow up, Mr. Chairman.

VICE CHAIR SAINE: You're recognized for a follow-up.

REPRESENTATIVE HAWKINS: And this is just, you know, full transparency, Mr. Chairman, so that the public can know that we're, you know, working with all cards up. Is there, you know, any -- I want to make sure that there have been no maps drawn outside of this building that any of us have been privy to. Can we say that unequivocally that that's been the case?

CHAIRMAN HALL: I can't speak for other members of this committee. What I'll say is that I

have not contributed to the drawing of any map, at all.

REPRESENTATIVE HAWKINS: Awesome. Thank you, Mr. Chair.

VICE CHAIR SAINE: Thank you.

Representative Warren.

REPRESENTATIVE WARREN: Thank you. I propose this to the Chair, but probably going to deflect it to Ms. Churchill. Can you explain what the matrix is on page 2 of this stack of maps?

VICE CHAIR SAINE: Ms. Churchill.

REPRESENTATIVE WARREN: I knew it. She can do anything.

CHAIRMAN HALL: When we're using the word "matrix," generally I'm going to go ahead and deflect that one on over.

MS. CHURCHILL: So, Representative Warren, I'm not sure that it is a matrix in the form that many people think of when you say that word. But it was our attempt to keep up with how the group from Duke was allocating the options to create the eight different combinations for a fully assigned statewide map.

So when you see the A1 option in the Duke House 01 through 04, that is associated with the

western part of the state, that northwestern corner that was unassigned in the fixed map. The option one, the combination is Surry, Wilkes, Alexander, for two members. And Alleghany, Ashe, Watauga, and Caldwell for two members. And so it's just, we wanted you all to know that we were trying to methodical and systematic, following the recipe. So it's just simply the designations they were using to tell us whether to add salt or to add sugar.

VICE CHAIR SAINE: Thank you, sir.

Any other questions for Chairman Hall?

Representative Brockman.

Representative Brockman, Representative Reives, and then Representative Harrison.

REPRESENTATIVE BROCKMAN: I know we're not considering race, but are we considering party registration when we're drawing the maps, as criteria?

CHAIRMAN HALL: Nope.

VICE CHAIR SAINE: Representative Reives.

REPRESENTATIVE REIVES: Thank you, Mr. Chair. I had a -- I wouldn't call them a series, but you may call them a series of questions --

VICE CHAIR SAINE: You're recognized for a series, sir.

REPRESENTATIVE REIVES: All right. Thank you.

I wanted to make sure, and I apologize if this is repeating anything, I don't know that I have the answer in my head, and I know that when we walk out of this room, that I'm going to get all these questions, so I'm trying to kind of figure out where we are.

So on the drawing of the maps, I think my big question is -- and I've got to get my glasses back on because I had to type this because I can't see, and I can't read anymore. See what you guys did to me in 10 months. I had 2020 vision when I got here.

But I guess first following up on Representative Hawkins' question, and again, it's just the question we've got to ask. He asked if there have been any maps drawn outside this building. I would like to know if there have been any maps drawn inside the building?

CHAIRMAN HALL: No. Great lawyer question. But no.

REPRESENTATIVE REIVES: Just making sure. I got to ask.

CHAIRMAN HALL: You know, again, I'm

speaking for myself, as the gentleman understands. I can't speak for what other members have done, on either side of the aisle, or in the Senate, but I have not participated inside or outside of the drawing of any maps, for this session.

REPRESENTATIVE REIVES: That's good. I appreciate that. And going on that same issue, and you really, you and I have talked, and now I want to say publicly, you have been very good about keeping me up to date with what we're trying to do, how we're trying to do it, and I appreciate that. And we had this discussions, but I want to kind of get it clearer now.

So my concern is similar to Representative Harrison's concern because here seems to be the problem that you run into. So let's say somebody -- and I'll use somebody who would never do this. I'm going to use Representative Bell. So let's say Representative Bell comes in and he's gone, and he's talked to, you know, non-member Billy Richardson, and Billy has said, "Oh, man. This would be a great map for you, John Bell, because, you know, you put all the democrats over here. You put all the republicans here. And then you got you all the black people here and the white people here, and all

that stuff." Obviously using racial and partisan data that we're not using.

And so then he says, "Here's my map, so you don't have to worry about drawing it." Well if Representative Bell, under what I'm hearing, brings that map in, sits it down in front of him at the terminal, and just draws it on a computer, then he, at that time, has been allowed to draw a map that's been drawn on a computer, so it can be used, but it's still using racial and partisan data.

And I'm just like Representative Harrison, I'm definitely not asking anybody to police anyone, but do we have anything in place that would kind of help prevent that? Because to me, that sounds an easy get around, in a legal sense, around the criteria that we've set up.

CHAIRMAN HALL: Well, you know, I would initially say that the problem that you face at the end of the day, as the gentleman already knows, and as I've said, I don't think I have the ability to police members of this committee, nor do I want to try to do that. I don't think it can effectively be done.

The committees of this -- the members of this committee have an elective duty to do things, I

think in the right way. And we have a set of criteria that we have used in here. I know I'm not going to bring in a map and sit down and draw it, but you know, the reality is, we're elected officials, and people will talk to us, and they call us all the time. And throughout this process, many members of the committee and the body are going to be told by folks, whether in their district or in the halls out here, what they think they should do.

And in fact, as many of the questions today have shown us, the members of this committee really want the public's comment. And, you know, those members of the public may say, "Representative Reives, I want you to draw the district this way and I want you to do this precinct." And that's up to you to determine how you want to handle doing that.

But at the end of the day, I think we've done all that we can, in the sense of we're only putting the data that's allowed to be used in the computers, in this room, and we've got a live audio feed, and a live video feed. I'm not sure that we can do a whole lot else, humanly, to prevent any sort of noise, so to speak, from coming in, other than doing those things.

REPRESENTATIVE REIVES: Is it possible,

just as a follow-up, that we could at least prevent the bringing in of a physical map to draw from? Is that something possible?

CHAIRMAN HALL: Yeah. You know, and you and I talked about this the other day, and I thought it was a great question, something I hadn't really thought about. And, you know, and I certainly, I see your point. But what I don't want to get into, as the chair of this committee, is when, you know, Representative Warren comes in here and he's got this big spread, me, you know, telling the sergeant in arms to take Representative Warren, you know -- or take his map away from him or take him out of this committee room. You know, I want to avoid that.

And, you know, it's one of those things that there might be a scenario where, you know, you draw one map in here -- you've been through this before -- you draw a map, you have it printed out, and you might take it with you to study it and think about it, and to determine what you want to do to perhaps change it. Maybe you want to take it to your constituents and say, "Look, here's what I'm thinking. What do you think about this?" And maybe they give you input.

And you might want to bring that very map back in here, that you drew in this committee, and sit down and, based on the changes -- the input, rather -- the input you've got from other folks, and make those changes. And I don't know how we would -- again, I go back to the word policing it -- how I -- I can't stand over somebody's shoulder and say, "Now that's not the map you drew in here. That's a map -- I don't know where that came from." I just don't -- I don't think it's possible to do that.

But what I can tell the members of this committee, as the chair, I won't be brining any maps in here to draw off of. But I want to be clear that when members of the public that are watching these live video feeds, or members who are sitting in the back, they're going to see members of this committee walking around with maps in their hands. Some people like to have a sheet of paper in front of them. You know, you're probably like me. I like to read, you know, a statue printed out, rather than read it on a computer screen, so that I can write on it, and think about it a little easier.

So, because of that, I'm afraid, you know, even if we tried to do that, the optics of removing members from this committee, and people seeing

people walking around with maps that have been printed out because they were drawn in here, I think it ultimately results in the best path forward to just say, you know, look folks, the map you draw has got to be the one that you do in here and nowhere else. And that's up to the members and their integrity as to how they want to handle that.

REPRESENTATIVE REIVES: And I would say then, based on that, I'm assuming we will be instructing members that you are not to use racial or partisan data in the drawing of the maps that you do in here.

CHAIRMAN HALL: Absolutely.

REPRESENTATIVE REIVES: And I would also, I guess, say that once we're down to the maps that we're going to be voting on, I mean, I would think that's something that we can ask members when they're presenting a map. You know, if a member comes up and says, "This is my map we're voting on," you could say, "Okay. You didn't use racial or partisan data," and that won't be considered out of line.

CHAIRMAN HALL: I think that's, you know, a fair question for any member of this committee or anyone in the House to ask those very questions.

REPRESENTATIVE REIVES: All right. Well then that gets us to the next question I've got. We've got criterion that we've put in place that we set up for the whole map drawing process. What my question is is what criteria are we going to use to choose between grouping options? Are we going to have some plain set out criteria saying this is what gives us the best grouping options?

CHAIRMAN HALL: So the committee is not going to adopt any specific of the options and groupings. We have said, as I said a moment ago when I was chairing, the only groupings that we're going to consider, are those that's in this packet. But as you know, and the committee members know, there are multiple possible groupings within that packet. We're not going to vote on which one members have to use.

So that's going to be up to the members of this committee what combination of groupings each member wants to use in drawing their maps. Within that, there might be, you know, one particular grouping, or set of groupings, that somehow results in a map that more fairly meets the criteria, over some other set of groupings. But that's -- you know, in large part, some of that is subjective.

Not all of it, but some of it is subjective.

But it's going to be up to the committee members to decide what set of groupings they want to use. We're not going to limit the committee to any one combination of groupings.

REPRESENTATIVE REIVES: Thank you for that. And back to some of Pricey's questions on the Voting Rights Act. Because I'll be the first to say, I don't practice in that area, so I don't profess to completely understand what we're supposed to do.

I think what my question would be is, what do you feel like our obligations are under the Voting Rights Act, at this point? Because I understand that you're saying that we won't be using racial data to determine what those districts look like, initially, which I think was done before. So what do you think our obligations would be and how are we going to comply?

CHAIRMAN HALL: Well, obviously, you know, we're obligated to comply with section two of the Voting Rights Act. But as I said earlier, we've seen a lot of litigation in this state, and you've followed that, I've followed it. I can't say I've read every line of every single case, because that's all you would ever do, you know, if you were going

to go do that. But I've read a lot of it, and in my opinion, what the plaintiffs have said -- so those folks who have tried to set aside maps -- have said -- and their experts, by the way. The experts that they hired to go to court for them. They've all said that there is no legally significant racially polarized voting in North Carolina.

That's the evidence in the record from past cases that we have. In my opinion, that's what the Covington Court found. So Judge Wynne found that there was no legally significant racially polarized voting in North Carolina. But certainly, the plaintiffs and their experts made that claim.

So without that, we believe, as we've done in the past two sessions that we've redrawn, not considering race is actually, not only proper, but it's the best way forward to make sure that we are complying with, not only the Voting Rights Act, but other state and federal laws.

REPRESENTATIVE REIVES: And also, based on the court decisions, I heard you earlier say that we are choosing not to use partisan data, but since there's no binding precedent -- was your statement about that -- then what obligations do you feel like we have, based on the case that talked

about partisan gerrymander? Do you feel like that we have any obligations based on that case, or that's just something we all have to talk about?

CHAIRMAN HALL: It's not a legally binding precedent. It's not an appellant, because the gentleman knows it wasn't an appellate court that made any of those decisions. So to answer the technical aspect of your question, it is not legally binding.

However, we have adopted some of the opinion in our criteria, so to the extent that we adopted it into our criteria, that's binding on this committee. We've also taken some things that we didn't really adopt as criteria, but simple instructions to the committee that was in that case, and that is all of these computer stations that we see around, the live audio, live video, we're voluntarily doing that.

Again, not binding on us at all. There is certainly no state law that requires this body to have TV cameras to watch us do anything. I mean, we can have -- we have to have open meetings, when the body's meeting, but there's no law that requires us to be transparent in this process. We are voluntarily choosing, at every single step along

this line. We are going above and beyond what the law requires us to do, in my opinion, in terms of transparency.

REPRESENTATIVE REIVES: All right. And I think I've got one follow-up that may be more appropriate for staff, but if you'll just determine, Mr. Chair, who is best to do it. Because while you were talking, I was also thinking back on the Voting Rights Act. I guess my question is, how do we know we're in compliance with the Voting Rights Act with a map then, if we're not using racial data during this time?

CHAIRMAN HALL: Well, again, I would fall back on what we've done in the past. And we have done this in the past in the very method -- with the very method that we're using right now. We haven't used racial data. And those courts have upheld that process. So we're essentially sticking with what works.

As the gentleman knows, this is an ever-evolving body of law around redistricting. All we can do is try to stick with what we know works based on past precedent. And in this particular instance, we're confident, just as we've done in the past, that we should not use racial data at all, and

that doing so, we'll be in compliance with all state and federal laws.

REPRESENTATIVE REIVES: Okay. And I'm going to repeat what I think I'm hearing, and just tell me if I'm accurate. So, if I'm hearing you correctly, we won't be doing anything proactively to see if we're in compliance. What we'll be doing is we'll draw maps, and it's our believe that those maps will comply. And then if the courts tell us they're not in compliance, then that would be when remedial measures would be taken.

CHAIRMAN HALL: In my opinion, not using racial data will ensure that we are in compliance with those laws. So yes.

REPRESENTATIVE REIVES: Okay. Got it. And when we get down to the point on voting on these maps, I mean, are we going to do any kind of culling -- I'm with you in the sense I want this to be more of an efficient process, and if I'm hearing correctly, what our process is, in theory, 120 members can walk in here and draw 120 maps, and then can have 120 amendments, which could really kind of have us all over the place. Is there anything that we're doing to kind of cull this down so that we're not voting on 120 maps when we make our committee

vote?

CHAIRMAN HALL: Well, you know, the gentleman may want to address that in caucus, before we vote on these maps. But outside of that, you know, it's one of those things that I don't know how many we're going to have. I don't want to sit here and say, now look, we're not going to consider -- we're only going to consider 10 maps, so come up with your best 10. I don't want to do that. I want to give members of this body who are elected the opportunity to be heard.

You know, on the floor, people can put forth amendments all day, just like, you know, we see them often do. And so we don't want to limit that. But what I'll say is, you know, if we get in here as a committee, and we've got a ton of these amendments and proposed maps coming in, at some point -- and the chair -- I will say, I will talk to you about this ahead of time -- at some point, you and I are going to have to get together and say, you know, we're going to have to talk to the folks in our respective caucuses and limit the number of maps and amendments that we're putting forth in this committee, and tell them, save it for the floor. If you want to put it forth on the floor, they're

certainly welcome to do that.

But what I'll commit to is an interactive process with you, especially, and really all the members of this committee, that we try to get it done in an efficient process. And that may take, you know, you and I putting our heads together and figuring out which amendments we should take up on this committee, and which may need to wait for the floor.

REPRESENTATIVE REIVES: All right. Well I think those are my questions. Thank you.

VICE CHAIR SAINE: Thank you, sir.

Next, Representative Harrison.

REPRESENTATIVE HARRISON: Thank you, Mr. Chair.

And Mr. Chair, I apologize for the barrage. I think these are really simple questions. If I heard Erika correctly, the public can draw maps on public terminals that are set up, but not in this room or in 544; is that accurate?

REPRESENTATIVE SAINE: Ms. Churchill.

MS. CHURCHILL: Yes, Representative Harrison. That is accurate. The drawing stations in room 544 and 643 are reserved solely for members of the General Assembly.

REPRESENTATIVE HARRISON: So as a follow-up to that, did I hear that we're only considering maps that are drawn in this room and in 544? And if that's the case, then what are we doing with the public's maps?

CHAIRMAN HALL: So --

Mr. Chairman, sorry.

REPRESENTATIVE SAINE: Go ahead.

CHAIRMAN HALL: So if a member of the public comes in, and as I've said earlier, just like any other bill, you know, one of your constituents or the member of the public may say, "Look, Representative Harrison, here's what I think you should do," you're obviously welcome to take a look at that. And herein lies sort of the friction between the position that Representative Reives talked about, and what you're saying right now.

So if I'm to say, as the chair of this committee, you cannot bring a map in here, period, well, if one of your constituents says, "Representative Harrison, I went to the portal downstairs, I drew this map, and I really think this is a good idea," and you agree with it, if we have that rule in place, you wouldn't be able to bring that map in this room. You wouldn't be able to take

into account the -- and that's literally public input that you wouldn't be able to take into account.

So the maps that we take up must be drawn in this committee room. Now, we'll talk about maps that are drawn, you know, downstairs, but with the same data loaded into the computers, and how we'll go about handling that, you know, if a member literally wants to take one of those up. But what I anticipate right now is requiring that it be drawn in this committee room.

REPRESENTATIVE HARRISON: I appreciate that, and I just have one question and I think I'm done. I must have missed the congressional map discussion. Have we talked about that? When does it happen?

CHAIRMAN HALL: So one thing I do want to clarify. So in this room, we won't be drawing any state Senate maps. Just as, you know, we're not going to let them screw up our state House maps, so they're not going to be able to draw ours. The congressional maps, so I think technically, and staff can correct me if I'm wrong, I think the data is in there right now to be able to draw a congressional map.

Is that right, Ms. Churchill, just in general --

Okay. So you could start on a congressional map if you wanted to. That's up to each member of this committee. I know my hope is is that we sort of tackle the state House map first, as a committee. So if you're drawing, just know, the first map that I anticipate taking up as a chair, is going to be the state House map. So you need to work on that one first if you want it to be ready to go to put forth whatever your amendment may be. And then after that, at some point, we'll do the congressional map.

REPRESENTATIVE HARRISON: If I could follow up --

VICE CHAIR SAINE: You're recognized for a follow-up.

REPRESENTATIVE HARRISON: And I'm sorry if you said this -- so when do you think we're going to be done with all these maps, in terms of us enacting them?

CHAIRMAN HALL: Yeah. You know, I really don't know when we're going to be done. What I'll say is that I believe we need to be done by the end of this month. We may have a few more days past

that, that the state board of elections can still give us turnaround. But the mindset that I've had is let's get this done by the end of October, that way everyone gets ample time to know what districts are going to look like and the state board of elections can get things done.

But, you know, the problem is, you know, we are drawing the whole map for the first time, I guess since 2011. And what we've done, you know, since I've been in this body -- I've been through this process a number of times, but it's always typically been with a more limited part of the map that we're required to redraw. So that's one of the issues. And that is, this is so unprecedented, we have never done it this way. This body has never drawn the whole map in complete public view with live audio, live video. We don't know how long that process is going to take. But, you know, the goal is to get it done by the end of October.

REPRESENTATIVE SAINE: Representative Carney.

REPRESENTATIVE CARNEY: Just one last question, and Mr. Chairman, thank you so much for your indulgence. And we're about to beat the Senate on this committee meeting length of all of us being

able to answer questions, so I appreciate that.

I'm just hung up on the maps being drawn in this room, and I'm trying not to be. Because on one hand we're stating that the only maps we will consider will be the maps that are drawn on these computers, in these rooms. But now I'm hearing that it doesn't preclude someone coming to me, from the public, and giving me information and a map, and then I come in here and transport it into the portal.

That takes that to the level of there can be maps -- and help me understand if I'm wrong -- there can be maps drawn outside of this building, from any group, and given to a member, or a group of members, and they can come in and put it into the portal. It would be under their name. Is that correct?

CHAIRMAN HALL: Well, I guess in a literal sense, you certainly could hear from somebody else, and come in here, and draw a map. And there's really nothing we can do about that. It's a first amendment issue. The members of this committee have a first amendment right to go talk and hear from their constituents. Their constituents have a first amendment right to talk to their legislatures. Well

even if you're not their legislature. The folks of this country have a right to say what they want to, and if you're walking down the street, they can come up to you and say, "Representative Carney, here's what I think you should do."

It's then up to you, as a member of this committee, to handle that in whatever way you see fit. Just like you would a bill. Some individual in your district, or not your district, may write out a bill for you. You're not going to go introduce that, obviously, and us vote on it to go through the bill drafting process. So in some ways, you know, it's very similar.

The other thing that I'll say though, I think what may be getting lost in the weeds is, when you actually sit down to do this, this is a big state. There's a bunch of precincts on the congressional maps. You have to get things -- with zero deviation it's going to be very difficult to sit down and memorize an entire map, and come in here and sit down and pinpoint, you know, wherever an outside map was that you saw.

But I think, fundamentally, the issue is going back to the law would allow exactly what you're saying, but even on another level. It would

allow you to go hire somebody to draw whatever map you felt like was the best map, and bring it in here, and put it before this committee. But we're going above and beyond what the law requires, in terms of transparency. We're going to require them to be drawn in here.

REPRESENTATIVE CARNEY: Thank you.

REPRESENTATIVE SAINE: Any other questions for Chairman Hall? Seeing none, I believe the business of the committee is completed today.

Is that right, Chairman Hall?

CHAIRMAN HALL: That's right, Chairman Saine. And the members, we'll be back in here at 9 o'clock in the morning. We'll gave in, and members will be able to draw. And let's see how much we can get done tomorrow and perhaps part of Thursday and see if we need to work on Friday.

REPRESENTATIVE SAINE: You've heard the gentleman. Come in tomorrow ready to work. With that --

I'm sorry. Representative Carney.

REPRESENTATIVE CARNEY: So that turned into one more question.

VICE CHAIR SAINE: You're recognized.

REPRESENTATIVE CARNEY: Does that mean that

the full committee, Monday through maybe Friday, if we have a duration, we are to be present in here every day that the maps are being drawn?

CHAIRMAN HALL: No. You don't have to present. That's completely up to you as a committee member. You can come for all of it or come for none of it. But it's up to you.

REPRESENTATIVE CARNEY: We have a choice. Thank you.

VICE CHAIR SAINE: We stand adjourned. Thank you.
